

Residual feed intake (RFI): An indirect approach for reducing GHG emissions.

**Basarab, Beauchemin, Baron, Ominski,
Guan, Miller and Crowley**

**Greenhouse Gases & Animal Agriculture Conference
23-26 June 2013, Dublin, Ireland**

**Agriculture and
Agri-Food Canada**

**Agriculture et
Agroalimentaire Canada**

Genetic Selection for Feed Efficiency – Why?

- **Safe, affordable, nutritious and environmentally sustainable beef products** (12-17% of global GHG emissions from ruminant production)
- **Increasing global population (FAO)**
 - *8 billion by 2030; 9 billion by 2050*
 - *Global demand for meat is expected to increase by 55%*
(3 billion people trying to move into the middle class in emerging economies will increase demand for meat)

Past Success

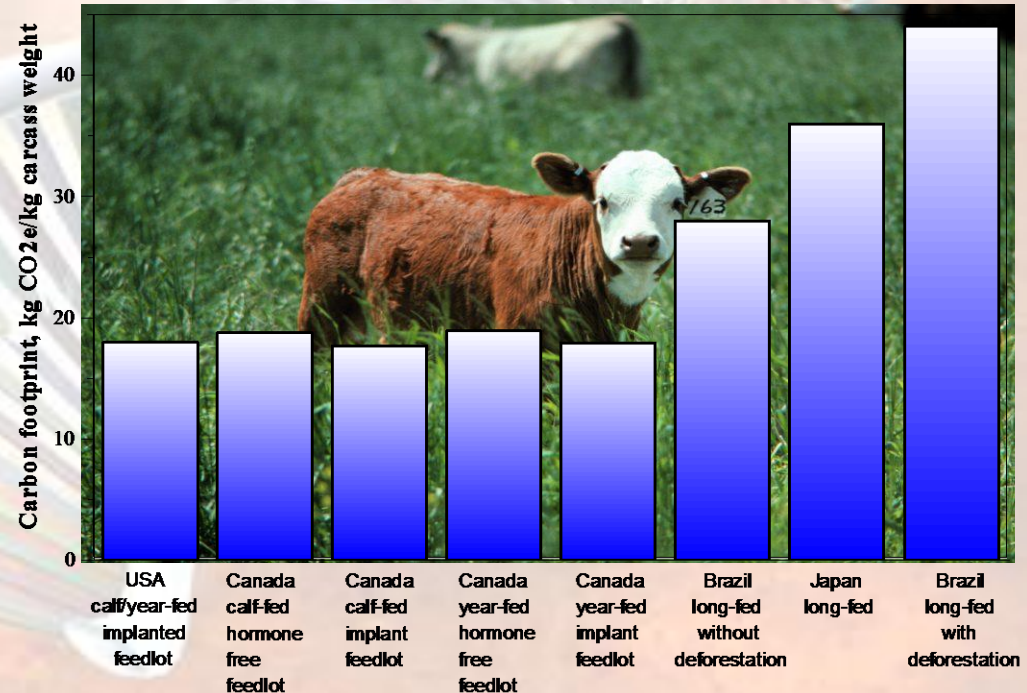

Production Efficiency 1977-2007

Same amount of beef now required

- 70% of the animals
- 81% of the feed
- 88% of the water
- 67% of the land
- resulting in a 16% decrease in the carbon footprint of beef

(Capper 2011, Animal Frontiers)

Carbon footprint by region and beef production system
(Basarab et al. 2012; Capper 2011)

% Change in greenhouse gas emissions and global warning potential achieved through genetic improvement (1988-2007)

Species	CH ₄	NH ₃	N ₂ O	GWP ₁₀₀
Chickens – layers	-30	-36	-29	-25
Chickens – broilers	-20	10	-23	-23
Pigs	-17	-18	-14	-15
Cattle – dairy	-25	-17	-30	-16
Cattle – beef	0	0	0	0
Sheep	-1	0	0	-1

CARBON FOOTPRINT (CO₂e/kg product); Pork 2.8-4.5 kg; Chicken 1.9-2.9; Dairy 1.3 kg; **Beef 18-36 kg**

Sources: Project for DEFRA by Genesis Faraday Partnership and Cranfield University (AC0204) from Hume et al. (2011), J. Ag. Sci., doi:10.1017/S0021859610001188 .

Trait criteria for Genetic Selection

- **Measurable with at least moderate repeatability**
- **Heritable**
- **Few if any adverse genetic correlations**
- **Economically (socially?) important**

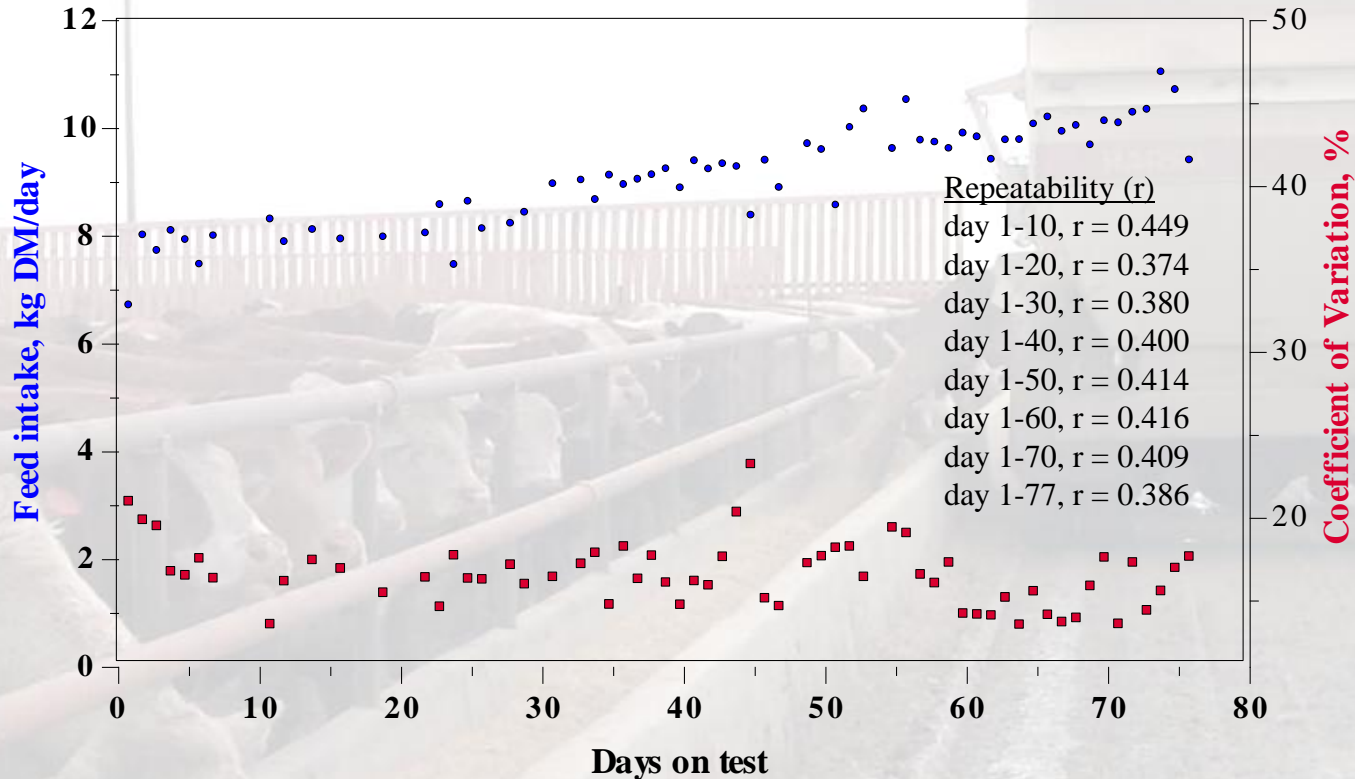

Measurable: Individual Animal Feed Intake Facilities

- body weight
- production
- ✓ gender
- ✓ age
- ✓ season
- ✓ temperature
- ✓ physiological status
- ✓ previous nutrition

Global GrowSafe capacity: ~68,000 animals; facilities in Canada (8%), US (76%), UK, Brazil, Aus (16%); Sunstrum 2012.

Repeatability (r) of Feed Intake

Feed intake for 99 young bulls fed a growing diet for 77 days
(72.1% barley silage, 24.6% barley grain & 3.3% protein sup., DM basis)

Feeder cattle
r = 0.325-0.407

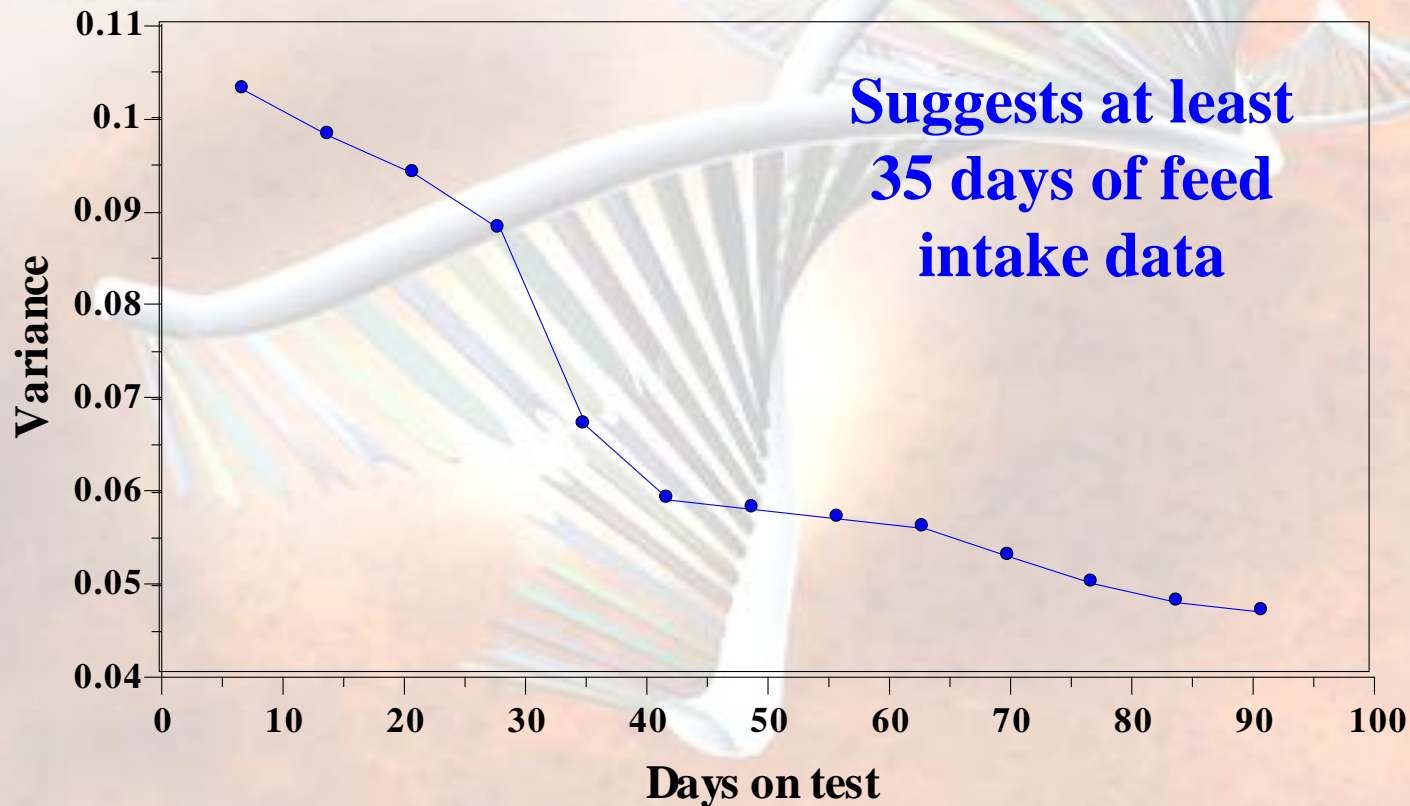

Repl. heifers
r = 0.286-0.380

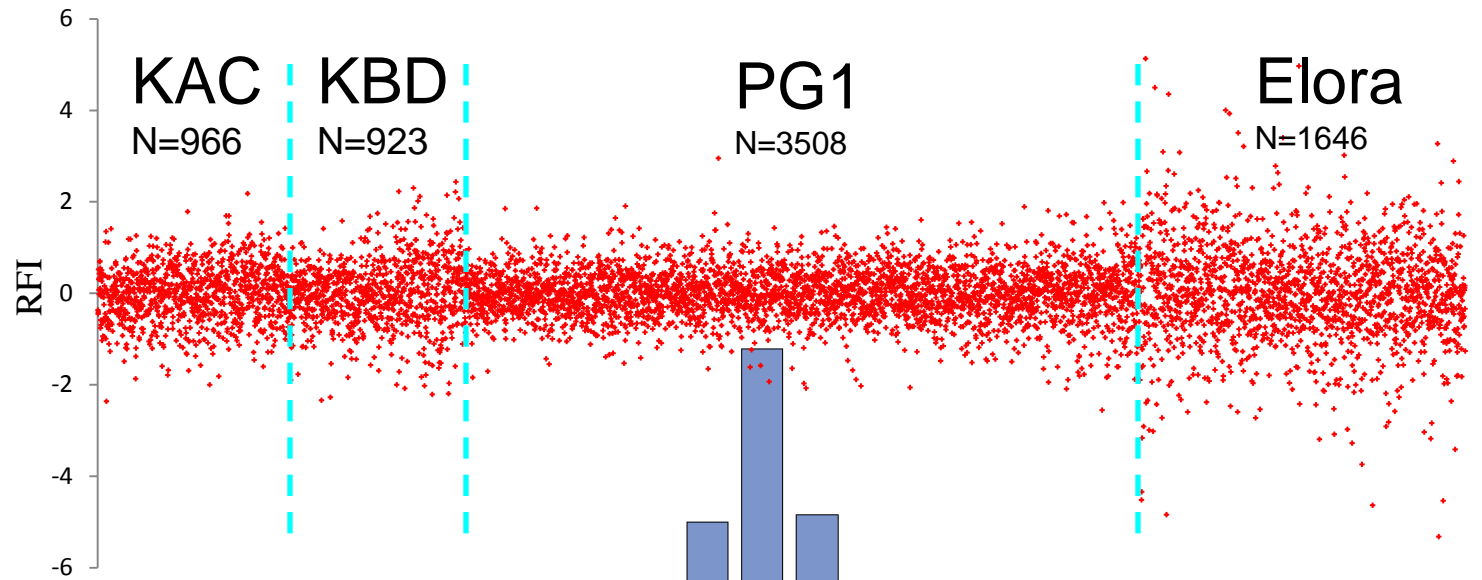

Young bulls
r = 0.374-0.449

Beef cows
r = 0.361-0.491

**r = within animal var.
across + within**

Effect of days of feed intake data on phenotypic residual variance (adapted from Wang et al. 2006, JAS, 84:2289)

Residual Feed Intake (RFI)

$$h^2 = 0.29-0.46$$

reflects energy requirement
for maintenance.

RFI: Feed intake adjusted
for body size and
production

Repeatability of RFI across diets

Grower diet vs. finisher diet, steers and heifers, $r_g = 0.45-0.62$

example, 75% barley-silage vs. 75% barley grain, as fed basis

Crews et al. 2003; Kelly et al. 2010; Duranna et al. 2011.

Heifers to 1st, 2nd and 3rd parity cows; $r_p = 0.2-0.4$

(Lawrence 2012)

Conclusion:

High & positive genetic association between RFI-g and RFI-f when cattle are consuming roughage vs. grain, but traits are not biologically equivalent

More importantly, no convincing evidence that bull and heifer RFI would be antagonistic to progeny RFI or feed intake as a cow.

Repeatability of RFI in heifers to cows

Preliminary data, Basarab et al. 2012

Traits	RFI measured as a heifer	
	High	Low
<u>RFI, kg DM/day</u>		
Number of females	12	11
8-12 mo old heifers	0.365	-0.373
4-7 year old cows	0.459	-0.375

Heifers fed 90:10 barley silage:barley grain, free choice

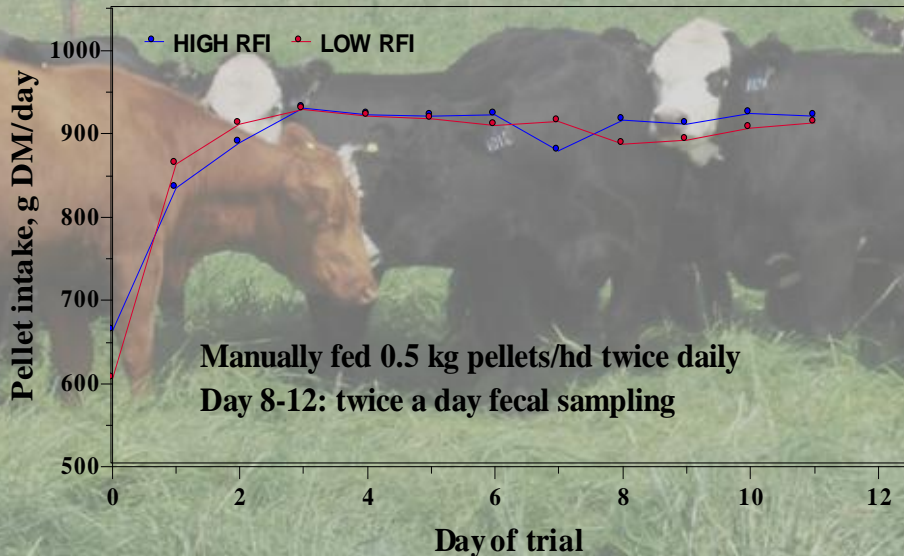

Cows fed 70:30% grass hay:barley straw cube, restricted to gain at 0.25-0.50 kg/day

Feed savings: Heifers: $0.74 \text{ kg DM/day} \times \$0.15/\text{kg DM} \times 365 = \$40/\text{heifer/yr}$

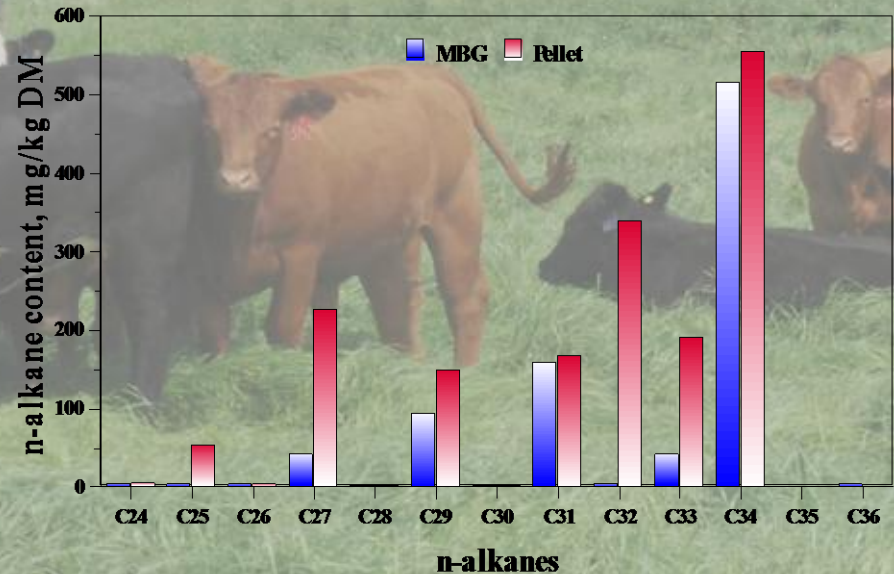

Cows: $0.83 \text{ kg DM/day} \times \$0.15/\text{kg DM} \times 365 = \$46/\text{cow/yr}$

Repeatability of RFI_{fat} during summer grazing

Daily consumption of n-alkane labelled feed pellets during a summer grazing trial

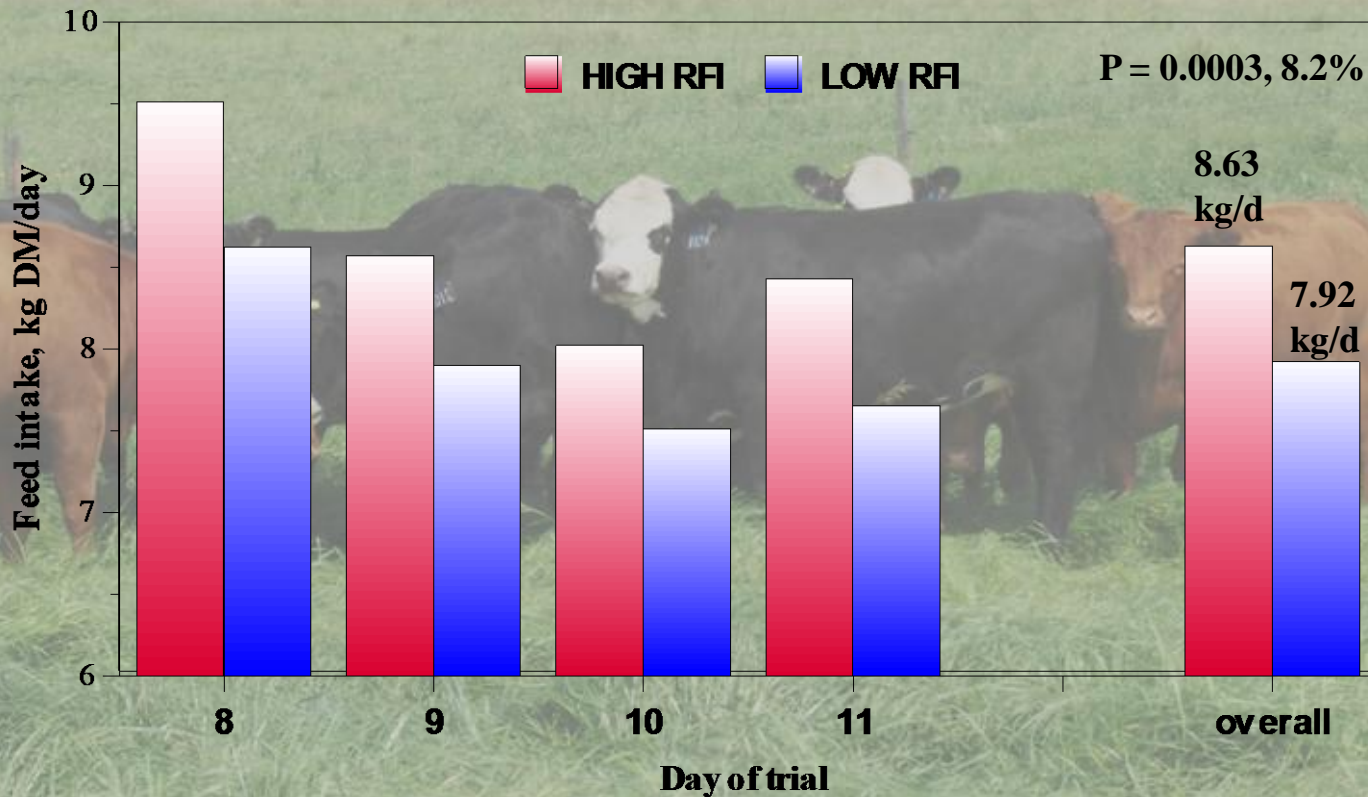

N-alkane profile of meadow brome grass and C32 labelled feed pellets during a 13 day grazing trial

DMI calculated based on forage, supplement and fecal content of C31 and 32, intake of supplement and dose rate of C32 (modified from Boloventia et al. 1994; Moshtaghi-Nia and Wittenberg, 2002)

Feed intake of high and low RFI_{fat} heifers during summer grazing (n=20)

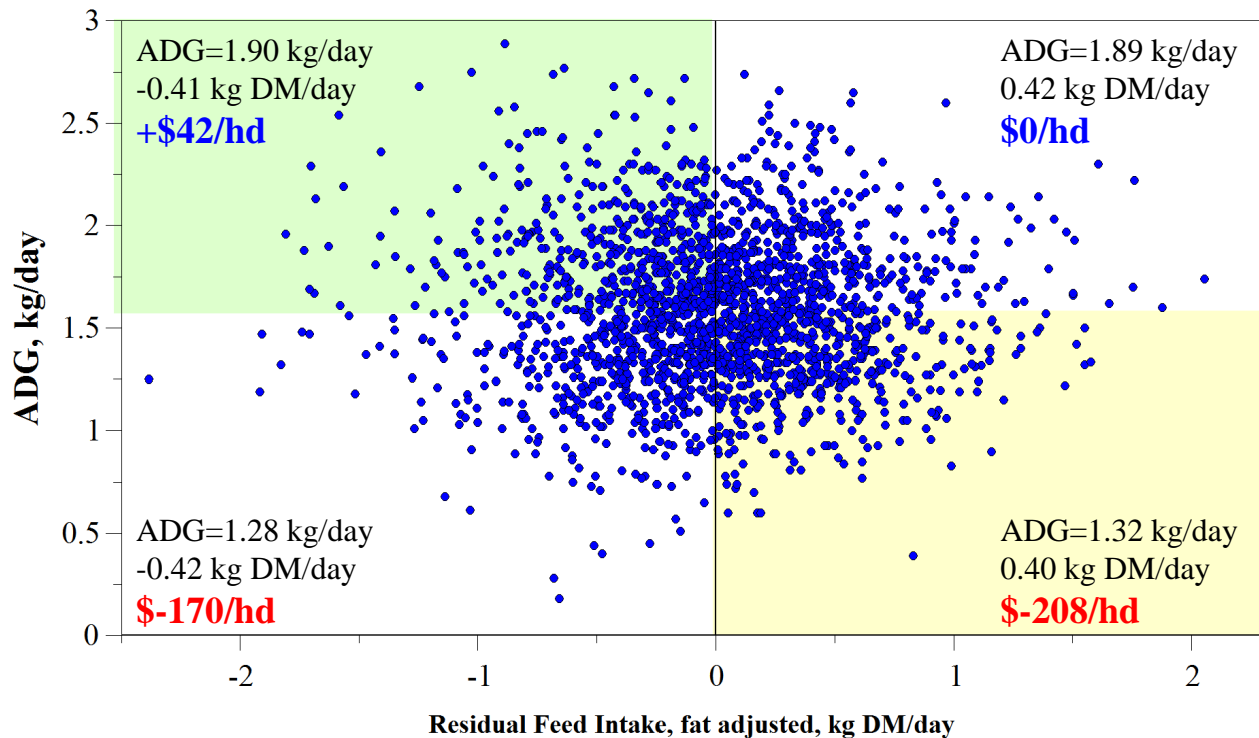

Growth and backfat,
Day 0-46:

HIGH: gain = 32.7 kg
ADG = 0.71 kg/day
BF=0.5
RF=0.7 mm

LOW: gain = 44.9 kg
ADG = 0.98 kg/day
BF=0.9
RF=1.3 mm

Correlation: growth & animal size

Correlations (r_p & r_g) are near zero

N = 2029 feeder heifers and steers

Arthur et al. 2001; Basarab et al. 2003; Crews et al. 2003; Jensen et al. 1992 Basarab et al. 2013

NOTE: Same feeder cost and price, transportation, vet & medicine, interest, yardage, death loss and marketing costs

Correlations: RFI to other traits

Traits	Direction in low RFI	phenotypic correlation	genetic correlation
DMI	lower intake	0.60 to 0.72	0.69 to 0.79
FCR	improved	0.53 to 0.70	0.66 to 0.88
Linear measurements	no affect	-0.08 to 0.15	-----
Feeding behaviours	lower	0.18 to 0.50	0.33 to 0.57
Docility /temperament	no affect	-0.01 to 0.09	0.07
DM & CP digestibility	2-5% improv.	-0.33 to -0.34	-----
Enteric methane	lower	0.35 to 0.44	-----
N & P excretion	lower	0.67 to 0.80	0.38 to 86

Summary of studies from Australia, Canada, Ireland and USA

Correlations: RFI to other traits

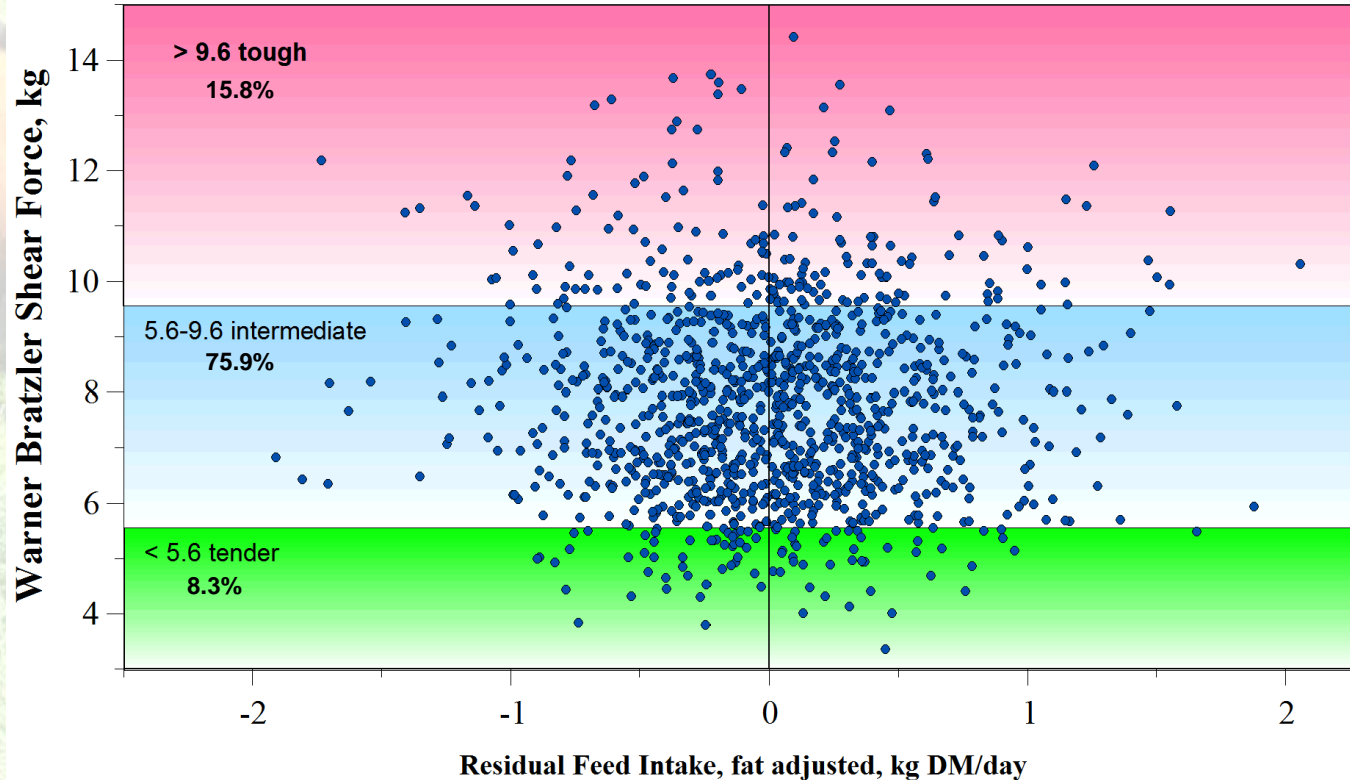

Traits	Direction in low RFI	phenotypic correlation	genetic correlation
Cow productivity	no affect	0.03	-----
Age at puberty	3-7 days older	0.00 to -0.16	-----
Bull fertility*	slight negative	-0.04 to 0.21	-----
5 Carcass traits	2-4% less fat	-0.07 to 0.27	-0.07 to 0.19
34 meat quality traits	no affect	-0.09 to 0.12	-----
WBSF**	little affect	-0.05 to -0.01	-----

Summary of studies from Australia, Canada, Ireland and USA

* sperm morphology and motility;

** may affect tenderness and texture due to decreased lipid and postmortem protein degradation

Relationship between RFIfat and tenderness in striploin steaks aged for 3 days (Basarab & Aalhus, 2013)

1186 heifers & steers striploins identified by DNA match to post-weaning blood sample

No or low relationship to 34 meat quality, sensory panel and retail quality traits

$$r_p = -0.09 \text{ to } 0.12$$

Three basic hypotheses: low RFI & low CH₄

- **Feed intake driven** - no effect on digestibility or CH₄ yield
- **Feed intake driven** –feed intake affects retention time (RT) and rumen volume (RV); longer RT and higher RV increased CH₄ emissions.
- **Inherent differences** in feeding behaviours, feed intake and RT result in host-mediated differences in microbial communities

Relationship between CH₄ emission and DMI

- determined in respiratory chambers
- Australian ($r^2 = 0.454$, $P < 0.0001$)
- Canadian ($r^2 = 0.677$, $P < 0.0001$)
- Adapted from Grainger et al. (2007), J. Dairy Sci.

IPCC 2006:

$$\begin{aligned} \text{CH}_4 \text{ production rate} &= ((\text{DMI, kg DM/day} * 18.45 \text{ MJ/kg DM}) * (6.5\%/100))/0.05565 \text{ MJ/g CH}_4 \\ &= (10 \text{ kg DM/day} * 18.45 * 0.065)/0.05565 = 215.5 \text{ g CH}_4/\text{day} \end{aligned}$$

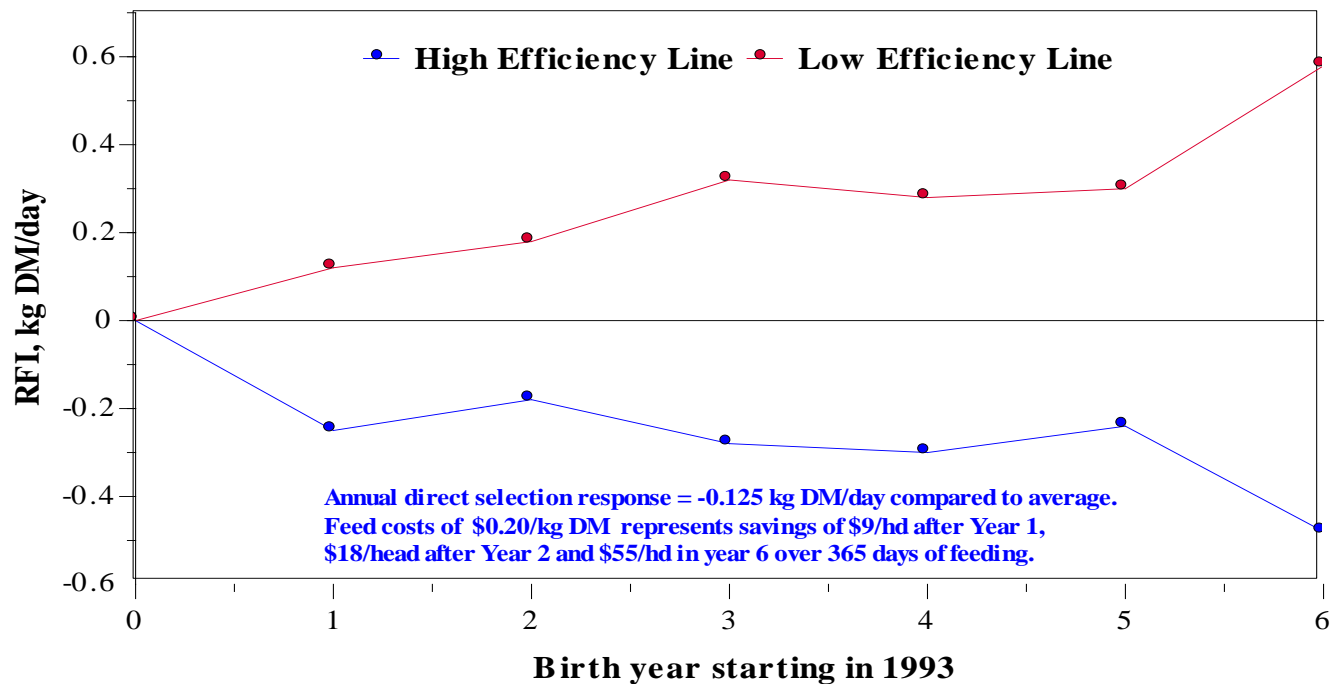

Methane production by feed efficiency group

Yuri Montanholi et al. 2011, University of Guelph (n=24)

Trends in estimated breeding values for residual feed intake (RFI) for High and Low feed efficiency selection lines from 1993 to 1999

Trangie Agricultural Research Centre, NSW, Australia. Adapted from Arthur et al. 2001

Annual rate of response =
-0.08 kg DM/day

25 year simulation; annual
reduction of 568,100 t
CO₂e/yr or \$8.5 million/yr in
carbon credits assuming
\$15/t.

Effects on manure CH₄ and
N₂O, cropping N₂O or
energy CO₂

Alford et al. (2006)

GHG intensity of a baseline and feed efficient herds after 25 years of selection for low RFI – life cycle assessment

Baseline herd - 120 cows

23.06 kg CO2e/kg carcass beef

Efficient herd - 120 cows

**↓ 14% GHG
13% land**

19.82 kg CO2e/kg carcass beef

Genetic selection for RFI or its component traits

- **improve feed efficiency, with no negative affects on cow productivity**
- **few antagonistic effects on carcass and meat quality**
- **small negative affects on age at puberty, but manageable**
- **reduce enteric methane and GHG emissions**

Repeatability of RFI_{fat} during summer grazing

Total GHG emissions four beef production systems

(CO₂ equivalents, 160 cow-herd assumed.)

Calf-fed, Hormone Free
Animal GHG emissions = 922,107 kg CO₂e

Calf-fed, growth implanted
Animal GHG emissions = 928,344 kg CO₂e

Yearling-fed, Hormone Free
Animal GHG emissions = 1,219,659 kg CO₂e

Yearling-fed, Growth Implanted
Animal GHG emissions = 1,237,082 kg CO₂e

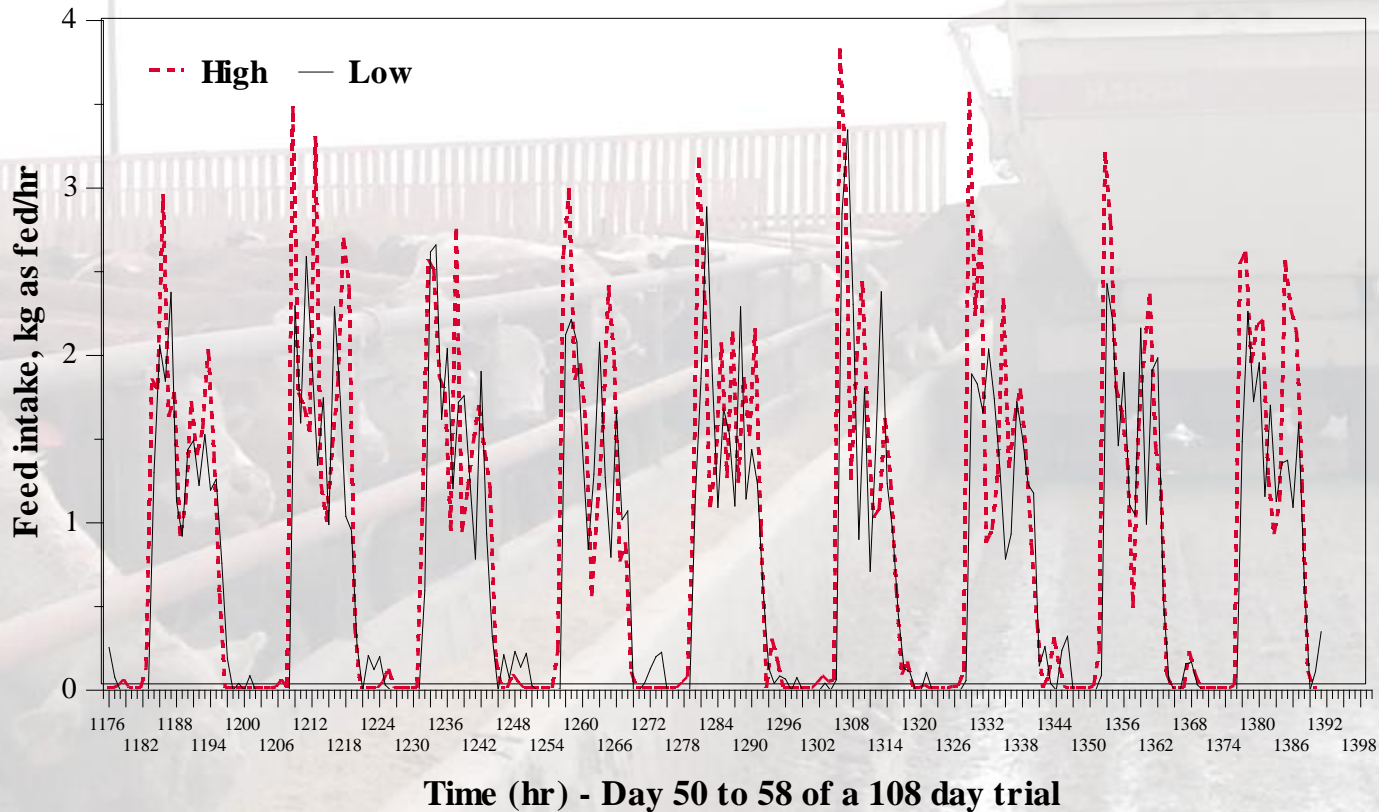

CH₄: 12-17% of global GHG emissions from ruminant production

COWS: largest consumer of poor quality forages, low biological efficiency

Basarab et al. 2012
animals 2, 195-220

Total GHG emissions include methane from enteric fermentation and manure, nitrous oxide from manure, carbon dioxide from energy use and nitrous oxide from cropping.

Daily feed intake pattern of the 10 highest and 10 lowest heifers for residual feed intake (RFI_{fat})

90%barley silage,
10% barley grain,
as fed)

Measuring Methane (CH_4) using open path laser

Dr. T. Flesch, University of Alberta

Measuring Methane (CH₄) using open path laser

Dr. T. Flesch, University of Alberta

Improve DM digestibility by 2-5%

**27 beef steers,
2x maintenance; high grain diet**

	<u>-RFI</u>	<u>+RFI</u>
DM dig., %	75.33	70.87
CP dig., %	74.70	69.76

Nkrumah et al. 2006, JAS 84: 2382

**16 rumen-cannulated early
lactating Holstein-Friesian heifers**

	<u>-RFI</u>	<u>+RFI</u>
DM dig., %	78.5	77.3
CP dig., %	77.2	75.2

Rius et al. 2012, J. Dairy Sci. 95: 2025

**Feeding behaviour and feed intake contributes to animals variation in
ruminal retention time and digestibility**

decrease metabolizability of the diet and increased heat increment of feeding
at high levels of intake above maintenance
