Notes:

(1) Harvested includes all forested stands with a height of less than 5 metres.

(2) Road include only permanent roads not included in the original AVI inventory.

Information:

- Areas for Non-Forest Vegetated, Non-Forest and Road stay the same in 1999, 2009 and 2019.

- Stands with a negative BHAGE have their height calculated as (Breast Height / (Total Age - BHAGE)) * Total Age.

- Breast height is 1.3 metres or 1.391 metres.

- Hydrological recovery (% Recovery) is dependant upon stand height. It is calculated as stand height * 20.

- Stands >= 5m in height are 100% recovered.

- ECA Area is calculated as (100% - % Recovery) * Harvested area.

- Total ECA is calculated as Harvested ECA + Road area.

- ECA Percentage is calculated as the Total ECA Area divided the sum of Forested, Non_Forest Vegetated and Road area by watershed.

- Watershed # 1, # 2380, # 2382 were divided into a Bull Trout and a Non- Bull Trout portion. A separate ECA % was calculated for each portion of these watersheds.
