Upper Hay Regional Ground Rules

Tolko Industries Ltd.  
Norbord Inc.  
La Crete Sawmills Ltd.  

ENDORSEMENTS

The Upper Hay Regional Operating Ground Rules, having been prepared in accordance with Section 16 (2) of FMA 0200040 and hereby endorsed this 12th day of June, 2015. The Executive Director of Forest Management Branch has also determined these ground rules will apply to FMU’s F11, F14 and F51.

**Definitions:**

**Deletion** – Those stands or portions thereof removed from the 10 year SHS after its approval.

**Deferred** – A stand or portions thereof that are sequenced in the first 10 year period but delayed from harvest until after that period.

**Variance** - Is defined as the sum of deletions and deferrals and is reported as per the Upper Hay SHS manager.

**Total SHS Area** - Is defined as the total SHS area within the FHP.

**SHS Area Harvested** - Is the planned and harvested area in the FHP.

**Additions** - Polygons added to the FHP that are not originally part of the 10 year SHS.

</tr>
<tr>
<td>9.3</td>
<td>Non-productive landbase created by timber operations shall not exceed five percent of each harvest area without prior approval of Alberta (see 3.5.5.1 e). Non-productive landbase is created by temporary roads, rutting, bared landing areas, displaced soil.</td>
<td>The total area covered by temporary roads, bared processing areas, and soil displaced during timber harvesting operations shall not exceed five (5) percent (%) of each harvest area without Alberta’s approval. Blocks less than 7 ha or narrow blocks may exceed 5% with these blocks reported on the as-built.</td>
</tr>
</tbody>
</table>
| 9.11  | Areas indicating the presence of permafrost shall have a permafrost protection plan completed. This plan shall include:  
  a) how permafrost is to be identified and what methods will be used (i.e., visual assessments, probing, photo interpretation, drilling and sampling of cores);  
  b) methods that will be utilized to eliminate/minimize damage to permafrost;  
  c) operator awareness plans/programs. | Areas with a known presence of permafrost shall have a Detailed Harvest Area Plan (DHAP) submitted as per section 3.4.9. This plan shall include:  
  a) how permafrost is to be identified prior to the commencement of operations and what methods will be used (i.e., visual assessments, probing, photo interpretation, drilling and sampling of cores);  
  b) methods that will be utilized to eliminate/minimize damage to permafrost;  
  c) operator awareness plans/programs. |
| 9.12  | Added                                  | Areas where permafrost is encountered during operations shall be reported to Alberta and operations shall adhere to methods described in 9.11 b) and c) or as approved by Alberta. |
| 11.1.2| All roads, regardless of class, with a lifespan of greater than five years shall be built under the authority of a LOC. | All roads, regardless of class, with a lifespan of greater than three years shall be built under the authority of a DLO. |
| 11.3.1.4| Added                                  | 11.3.1.4 Temporary road construction activities that are required outside an approved ROW can be considered incidental to construction and will be approved as part of the AOP provided the following is met: |
a) Be immediately adjacent to AOP approved disposition (temporary road and associated ROW only);
b) Be reclaimed or reforested in the same fashion as the adjacent AOP approved disposition (if applicable);
c) Be without conflict of existing dispositions and/or adjacent land uses; AND
d) Be an activity type and within the parameters as described below:

- Log Decks or Decking Areas:
  i. $\leq 0.18$ hectares in size;
  ii. Located on average $\geq 400$ metres apart.

- Bank Stabilization:
  i. Related to hill cuts impacted during construction.

- Push Outs:
  i. $\leq 0.04$ hectares in size;
  ii. Located on average $\geq 800$ metres apart. Where this distance is not feasible due to operational constraints, line of sight between push outs should be minimized.

- Helipads
  i. $< 0.1$ hectares in size;
  ii. Located on average $> 800$ metres apart;
  iii. Focus on lesser vegetation and existing openings.

Upper Hay Regional Ground Rules
Upper Hay Regional Ground Rules

1.0 GROUND RULE SCOPE

Ground rules are the practices used in planning and conducting timber harvesting operations which constitute the methods used to implement decisions made in the forest management plan (FMP) and other higher level plans such as integrated resource plans (IRPs). In the event that these strategic plans do not exist, the ground rules shall establish practices that minimize the chance of negative impacts from roads, timber harvesting and forest management operations and activities. Authorizations by Alberta do not imply authorization under federal legislation and requirements, notably the federal Fisheries Act and Migratory Birds Convention Act. The proponent may require advice and approvals of the federal agencies (Department of Fisheries and Oceans, Environment Canada) regarding federal legislation requirements.

Delegated Authority (Alberta) has the authority to approve Annual Operating Plans and may also waive or amend the application of specific ground rules in unusual or special circumstances. However, waivers must be completed in writing and conform to departmental policy, the Forests Act, the Timber Management Regulation, the Public Lands Act and all other applicable provincial legislation or statutes.

1.1 REGULAR REVIEWS

The intent is to have an annual review of ground rules if requested by either forest disposition holders or Alberta. This is not meant to be a complete redevelopment but rather an opportunity to fine-tune the ground rules. It is expected that regular reviews will allow participants to plan revisions more systematically and to correct any inconsistencies or problems. It will also create the ability to regularly consider modifications that reflect the best and most current knowledge and tools available. The annual review of the ground rules shall be conducted so that proposed changes will be limited to addressing non-bolded text which may be modified to meet local needs. Ground rules where bolded text is mandatory would only be changed if, in Alberta’s opinion, the result is a higher standard of practice.

2.0 THE TOPICS

Each topic includes a purpose, discussion, and ground rule heading. All ground rules shall be written following this format.

**PURPOSE**

A statement of what the topic is designed to accomplish.

**DISCUSSION**

Include background information, research knowledge, and reasons for the concern. The discussion shall focus on why a ground rule is needed. Alternative actions or solutions could also be discussed here.
GROUND RULES

These are definitive statements of the desired results to be achieved and a clear indication of what is expected. The ground rules shall be relevant, measurable, understandable and achievable.

3.0 OPERATIONAL PLANNING

3.1 PLANNING PROCESS

PURPOSE

The operational planning process is designed to expedite the implementation of the FMP. Where management direction has not been established through an approved FMP, then required decisions shall be made during this operational planning process.

DISCUSSION

The operational planning process includes five main components:

1. **Approved Forest Management Plan (FMP)**
   - Spatial Harvest Sequence (SHS) for first two 10-year periods
   - Approved Long Term Access Plan

2. **Compartment Assessment (CA)** – In the event that the SHS is deemed by Alberta to be inappropriate due to a significant change in circumstances since the approval of the FMP, a compartment assessment describing current issues, shall be required (see section 3.2).

3. **General Development Plan (GDP)** – The GDP gives a comprehensive description of a forest operator's proposed harvest strategy, road building plans, and reclamation operations for a five-year period, and includes all licenses and permits. The GDP is used to guide integration of activities.

4. **Forest Harvest Plan (FHP)** – The FHP is a map and associated report showing the laid out harvest plan (see section 3.4).

5. **Annual Operating Plan (AOP)** – The AOP describes operations in detail through a series of components that shall be submitted together at the same time, or as individual submissions on a schedule approved by Alberta:
   a) Operating Schedule and Timber Production
   b) Applicable FHPs
   c) GDP
   d) Reforestation Program
   e) Fire Control Plan
   f) Road Plan
3.2 COMPARTMENT ASSESSMENT (CA)

PURPOSE

To address significant issues that have arisen since the approval of the FMP.

DISCUSSION

It is recognized that circumstances change over time and it is possible that the SHS approved in the FMP may prove to be inappropriate. Where Alberta deems it necessary, a CA shall be completed to adjust the operational plan for the area. CAs are necessary when major new issues or information that have been identified since FMP approval make the SHS inappropriate (e.g., forest fire, insect or disease, species of special concern, a major change in land use direction or an unacceptable variance of >20% of the SHS/compartment/decade as determined by the Delegated Authority and the manager of Forest Management Branch (FMB)). The CA shall describe how the new issues will be incorporated into the FHP. In completing the CA, operators must consult in a meaningful way with stakeholders and strive to reach general agreement on issues. The CA provides an opportunity to reconsider management strategies at the time of operational planning if warranted.

GROUND RULES

3.2.1 Alberta shall decide on the boundaries of the area on which a CA is required after consultation with the forest operator.

3.2.2 If a CA is required, the operator must receive Alberta’s approval for the CA prior to the submission of an FHP.

3.2.3 A CA is considered current if it has been approved by Alberta and the FHP is submitted to Alberta within three years of approval.

3.2.4 The CA shall include any maps, analyses, and reports deemed necessary by Alberta to adequately address the issues.

3.3 GENERAL DEVELOPMENT PLAN

PURPOSE

To provide a projection of activities for the next five years to:

a) guide the integration of activities;

b) schedule timber disposition administration activities;

c) predict cut control status;

d) co-ordinate the development and reclamation of roads.

DISCUSSION

The primary components of the General Development Plan (GDP) include a forecast of the areas scheduled for harvest over the next five-year period and a summary of deviations from the harvest sequence for existing FHPs or long-term road plans outlined in the FMP. The GDP must also include the current status and forecast of the respective annual allowable cuts (AACs) and cut-control period for each of the operators within the planning area.
In addition to outlining the projected wood supply forecast, the GDP shall also include details regarding road requirements, silviculture activities, and strategies to address fire management, forest health, and fish and wildlife issues within the planning area. It is expected that there will be substantial discussion on significant issues with Alberta before the FHP is submitted. Consultation of the GDP with First Nations is a requirement of Alberta’s First Nations Consultation Guidelines on Land Management and Resource Development.

GROUND RULES

3.3.1 The GDP submission date is June 1 of each year unless otherwise approved by Alberta. Alberta shall respond within 30 days. The GDP shall be approved subject to an appraisal by Alberta.

3.3.2 The GDP shall contain a summary of variance from the harvest sequence. Variances must be reported to Alberta (as per section 4.1) and may be submitted as part of as-built report.

3.3.3 The GDP shall describe volume supply by area, road standards and construction schedule, and reclamation activities. The plan is a notification to Alberta of proposed activities and exceptions (3.3.2 above) to guide future regulatory activities. Other forest operators affected by the GDP must agree in writing (e-mail notification acceptable) to the GDP before it will be approved (see section 5.1.1). It is the responsibility of the operator to ensure that an over-cut exceeding that allowed in their tenure document is not exceeded.

3.3.4 When a major change in a company's general development strategy is proposed after the GDP is received, a revision may be requested by Alberta where the change may affect issuance of dispositions, the orderly review of AOPs, or integration with other forest operators.

3.3.5 The GDP consists of the following:

1. Schedules with the following information:
   a) the areas to be harvested (by compartment) each year of the next five-year period;
   b) timber production objectives for all dispositions (by year);
   c) Class I, II and III road developments showing planning and construction time lines and the status of DLO applications;
   d) all roads noted that are to be monitored, and all outstanding and anticipated reclamation work related to DLO road and stream crossings abandonment;
   e) a brief description of potential issues arising from the proposed harvest activities that have been identified through discussions with Alberta or other known resource users;
   f) proposed and actual volumes in satellite yards;
   g) a description of deviations from the FMP long-term corridor plan supported by appropriate documentation;
   h) declaration of outstanding operational items including debris disposal, or an agreement with Alberta on reporting of outstanding operational items;
   i) as built plan (includes shape files of harvest boundaries, final road locations, structure retention patches, and an updated AOP Appendix 1(for the purpose of cut allocation)) from the previous year’s harvest. As-built plan may also include cumulative variance report as per 4.1. This may be submitted under separate cover at an agreed upon time.

2. A map (of appropriate scale) that shows the following:
   a) the mill site location;
b) proposed haul routes (differentiating existing roads from roads to be constructed) and primary routes to be used for reforestation access;
c) satellite yard locations;
d) the timber dispositions to be operated;
e) other important forest resource areas or facilities that could be directly affected by logging; and
f) the general location of routes, dispositions and facilities where reclamation work is scheduled and where roads and watercourse crossings are abandoned.

### 3.4 FOREST HARVEST PLAN

**PURPOSE:**

To describe the laid out harvest and road design.

**DISCUSSION**

The primary components of an FHP are a map and report that clearly show and document the harvest area boundaries, roads and water crossings for the compartment. The design shall be valid for five years from the time of approval, unless issues deemed significant by Alberta arise during this period.

**GROUND RULES**

3.4.1 An FHP shall be approved by acceptance if:
   a) validated by a RFP;
   b) deletes less than 20% of the area sequenced in the SHS by compartment per decade;
   c) the harvest area does not exceed 100% of the total area in the SHS or strata description table by compartment per decade; and
   d) it adheres to all ground rules as per the FHP checklist (see appendix 5).

Where the FHP does not meet one or more of the above standards, the FHP shall undergo a full review by Alberta. Variances from the SHS shall be reported annually in the FHP in a format acceptable to Alberta (see section 4.1.1).

3.4.2 Any proposed new harvest areas not included in the approved SHS shall address the following criteria:
   a) protection of watershed and riparian values;
   b) maintenance of effective habitat for species of special concern;
   c) meet visual quality objectives;
   d) efficient forest management operations are feasible;
   e) desired future forest structure;
   f) fire threat is acceptable.

3.4.3 If a CA was completed, the FHP shall undergo a full Alberta referral, review, and appraisal to ensure the direction in the CA has been implemented.

3.4.4 All FHPs submitted by operators who harvest more than 30,000 m³ each year from crown land, must be validated by a registered forestry professional (RFP). Validation means that, the operating ground rules (OGRs) were followed, the SHS was followed or variances identified, and all affected operators have agreed to the design (see section 5.1.1).
3.4.5 Maps shall accurately show the following information:
   a) the approved forest inventory;
   b) approved SHS and variances from the SHS as per 4.1.1;
   c) all laid out inter-harvest area roads and associated watercourse crossing
      locations;
   d) current dispositions and reserves (e.g., registered trapline boundaries,
      permanent sample plot locations);
   e) watercourses, their classifications and protective buffers;
   f) springs, water source and seepage areas;
   g) road corridors and license of occupation (DLO) numbers and classes for both
      existing and proposed roads. Locations of access control measures;
   h) current information on previously harvested areas, existing trails, seismic lines,
      power lines, pipelines and access routes;
   i) sensitive wildlife sites as per section 7.7.6.2.

3.4.6 In addition to the FHP map, the following information is required:
   a) area (ha), and coniferous and deciduous volume for each proposed harvest
      area;
   b) SHS map with an overlay of laid-out harvest areas depicting all variances from
      the SHS;
   c) summary table of variances from the SHS by harvest area for each FHP with a
      summary by compartment (see section 4.1.1);
   d) reforestation strata designation for each harvest area;
   e) dispositions;
   f) description of how the CA is addressed in the FHP;
   g) access control methods employed;
   h) description of integration with other users (see Section 5.1.1).

3.4.7 Road design and location shall be described for all roads joining harvest areas, and
DLO roads to be constructed for extraction of timber from all proposed harvest
areas, if not identified in the phased road planning process or the FMPs long term
road development plan by the forest operator. These road comments include the
following:
   a) road design, classification, season of use;
   b) choice of corridor location and width;
   c) considerations made for other road users;
   d) considerations made for non-timber resources;
   e) rationale for choice of stream crossing location, choice of crossing structure,
      and design information;
   f) integration of existing roads into the design.

3.4.8 If applicable, the following comments shall be mapped and/or described for each
harvest area:
   a) harvest area comments shall be included in a block comments table;
   b) layout bordering and encompassing riparian management zones when different
      than the standards in section 6.0;
   c) in harvest areas, the number of planned watercourse crossing locations with
      actual crossing location for ephemerals included in the weekly block report;
   d) layout bordering restricted areas (e.g., permanent sample plots (PSPs), private
      land);
   e) identification of understory;
   f) harvest area-specific structure retention and woody debris management
      strategies;
   g) tactics to address forest health issues;
   h) protection of roadside vegetation - and how to be done;
i) strategies to attempt to maintain sight distance of 400m or less from Class I, II or III roads;

j) need for a detailed harvest area plan (see section 3.4.10);

k) important wildlife sites as defined in section 7.7.6.2 (this information shall be made available for resource planning purposes only through Fish and Wildlife);

l) cultural and historical site considerations (this information shall be made available for resource planning purposes only through Alberta Culture);

m) soil protection measures for unfrozen ground timber operations.

3.4.9 Detailed harvest area plans (DHAP) are required when there is higher than average potential for environmental damage if operations are not carefully planned. Circumstances that merit DHAPs are:

a) areas of steep topography requiring specific road location and construction or specialized harvesting equipment;

b) unstable slopes are generally to be avoided but if this is not possible it is necessary to plan operations carefully to minimize impacts;

c) harvest areas with numerous water source areas, seepages, intermittent, or ephemeral watercourses;

d) harvest areas that contain sensitive wildlife areas;

e) harvest areas requiring understory protection using protection techniques (see section 7.5);

f) harvest areas located near high-value recreation areas, tourism areas, and facilities;

g) partial harvests, excluding commercial thinning (CT) and pre-commercial thinning (PCT);

h) harvest areas exceeding 100 ha in the SHS;

i) harvest areas in known permafrost areas or areas where permafrost is identified during layout (additional requirements as per section 9.11)

The DHAP shall include a map of appropriate scale to the issue(s) and describe how the concern will be addressed in operations. DHAPs are not submitted to Alberta but must be available upon request.
3.5 ANNUAL OPERATING PLAN

PURPOSE

To annually authorize all road, harvest and forest management activities for the operator.

DISCUSSION

The AOP articulates in detail the activities proposed for the current year and must be approved by Alberta before timber operations shall commence. The AOP components include:

a) Operating Schedule and Timber Production
b) Applicable FHPs
c) CAs (if applicable)
d) Reforestation Program
e) Fire Control Plan
f) Road Plan
g) GDP

Refer to Appendix 1 for RFP validation requirements.

For timber permit operators and small quota holders who harvest less than 30,000 m$^3$ annually, Alberta has alternate AOP submission requirements.\

GROUND RULES

3.5.1 The AOP submission date is November 1 of each year unless otherwise approved by Alberta. Alberta shall respond within 30 days. The AOP shall be approved by Alberta subject to the outcome of the review.

3.5.2 The Operating Schedule and Timber Production, Reforestation Program, Fire Control Plan, and Road Plan are submitted as in 3.5.1 above, unless otherwise agreed to by Alberta. The schedule for submitting any necessary CA, GDP and FHPs may be different.

3.5.3 Only harvest areas and roads with FHP approval shall be scheduled for operations in the AOP submission.

3.5.4 The AOP shall contain the following components:

a) the map(s) referred to in 3.4.5 above including shape files of approved FHP harvest areas;

b) administrative and timber production information:
   I. name of disposition holder(s),
   II. number of the disposition(s),
   III. date of submission and effective period,
   IV. location of mill where timber will be manufactured or processed, unless alternative reporting has been approved.
   V. where all volumes (deciduous and coniferous) will be charged (quota, deciduous timber allocation, FMA, commercial timber permit (CTP)),
   VI. proposed harvest volume to be harvested by timber disposition,
   VII. application for dues relief specific to the AOP (including all the detail required by Alberta),

\[\text{1} \text{ TM118 form}\]
VIII. community timber program operators shall include all road use agreements,
IX. scaling methodology (e.g., weigh scale, other arrangements),
X. utilization standards,
XI. declaration or list of land use notifications (see section 5.0);
c) operating schedule – a table which outlines:
I. list of harvest areas proposed for harvest (including area and volume by species or species group, with totals);
II. lists of roads proposed for construction and reclamation for non-DLO roads, except in-harvest area roads. It includes watercourse crossings to be built or installed or removed/maintained. Not required if submitted as part of the GDP for reclamation;
d) annual reforestation program (see section 8.2);
e) forest protection plan which covers suppression equipment (see section 7.3 Fire Management, ground rule 7.3.5);
f) road plan (see section 11.2.3);
f) GDP and CA if applicable;

3.5.5 All amendments to harvest plans must be justified and submitted to Alberta in writing. RFP validation of all amendments is required. Any changes must be incorporated into the as-built plan (move to AOP).

3.5.5.1 Changes meeting the following criteria are considered ‘Minor Amendments’, and require only company RFP validation and notification to Alberta. Minor Amendments don’t require Alberta’s approval, provided all appropriate background checks (e.g., land status automated system (LSAS)) have been made and rationale for the change has been provided (changes can be implemented prior to notification but must be reported on the next operations report after implementation). Changes shall not adversely affect buffers established for the protection of riparian areas, wildlife sites, historical resources, or aesthetic values.

Any change to the approved AOP not listed in 3.5.5.1 shall be treated as a major amendment and requires the approval of Alberta prior to implementation. Alberta will provide the company feedback and/or approval of the AOP amendment within 10 working days of the submission.

a) Additions to the approved AOP harvest area boundary where the final area does not vary from the area in the approved FHP by more than ten percent or 1 ha whichever is greater. Any additions to block areas must be approved by a company supervisor prior to the change being carried out. Any resulting variances from the approved SHS must be categorized and reported as per 4.1.1. This ground rule does not apply to CTPs and deciduous timber permits (DTPs) and all additions to a harvest area must be within the company’s disposition and landbase and be approved by Alberta.

b) Any deletions to block areas must be approved by a company supervisor prior to the change being carried out and cannot exceed the variance tolerance in 3.4.1. Any resulting variances from the approved SHS must be categorized and reported as per 4.1.1. This ground rule does not apply to CTPs and DTPs and all deletions to a harvest area must be approved by Alberta.
c) Exterior block roads moved to existing access or conventional seismic lines where re-growth is less than 3 m and new clearing distance to get from the approved AOP access to the existing access does not exceed 100 meters.

d) Exterior block roads requiring the development of new right-of-way (ROW) clearing (not detailed above) that are moved up to two ROW widths from the approved FHP road location. ROW is considered to be the maximum ROW allowed in Table 3 for the class of road proposed. A company supervisor shall approve this move prior to the change being carried out.

e) The interior block roads may be moved as required provided no additional watercourse crossings are required outside of those allowed in (g) and the total amount of soil disturbance does not exceed the amount in 9.3. Changes will be reported on the next operations report.

f) Water course crossings structures that have been upgraded from the approved FHP.

g) Adding or changing a crossing location on ephemeral or intermittent water courses shall be reported on the next weekly report. Snowfills on small permanents may be added or location changed as above.

h) Change of a scheduled harvest area harvest season and its associated roads (including road standard changes) from non-frozen to frozen.

3.6 SALVAGE PLANNING

PURPOSE

Salvage planning shall be implemented when necessary to reduce the potential for loss of fibre.

DISCUSSION

Under certain circumstances, planning shall be expedited to reduce the loss of fibre from fire, disease or insect infestation, blowdown or other such unforeseen disturbances.

Salvage planning shall not be used when:

a) the disturbance regime is slow moving and can be accommodated under conventional planning timeframes and protocols;

b) the regime is not an imminent threat to green fibre;

c) fibre loss is deemed to be within an acceptable range.

Salvage planning does not confer rights to the planner to ignore other values, or the inherent value of a natural disturbance. It does allow for consideration of all values and for prompt, qualified, professional opinion to drive the process.

GROUND RULES

3.6.1 Salvage planning is initiated on the natural disturbance when deemed appropriate by Alberta.

3.6.2 An FHP for the salvage area must be developed, and shall form part of the AOP. Modified timelines and content for the FHP shall be considered by Alberta. Detailed requirements may be published from time to time by Alberta. It is expected that there will be substantial discussion to resolve significant issues with Alberta before the FHP is submitted.
4.0 UTILIZATION

4.1 STAND UTILIZATION

PURPOSE:

To track variance from the approved FMP SHS as well as total area harvested in order to:

- ensure a sustainable harvest level and future forest objectives are maintained through operations adhering to the FMP;
- improve information for the next FMP (e.g., landbase, yields);
- make decisions around FHP acceptance.

DISCUSSION

The Alberta Forest Management Planning Standard, Annex 1, Section 6.0 Harvest Planning Standards indicates scheduling of stands through the FMP SHS is dependent upon the timber merchantability criteria allocated in the disposition holder’s tenure document (e.g., FMA, quota certificate) and the management assumptions used in the timber supply analysis (TSA). Pertinent assumptions are comprised of deletions from the net landbase (e.g., subjective deletions, stream buffers, protected areas) and parameters that determine a stand’s eligibility for harvest (e.g., earliest age of harvest). The SHS results from the analysis of these TSA inputs coupled with basic field reconnaissance. The SHS identifies spatially (subunit and location) and temporally (period) the queue of stands that will produce the sustainable timber harvest level (AAC) and desired future forest condition.

Adhering to the SHS is imperative to achieving the timber supply forecasts and the forest conditions expected. Variance from the SHS will not allow the FMP to realize its objectives and forecasted outcomes. Operational variance is unavoidable but must be effectively managed.

Variance shall be monitored and reported where:

1) merchantable stands scheduled in the first decade of the SHS are not harvested in that decade; and

2) special features not identified in the FMP net landbase are encountered during layout or harvesting and are deleted from the SHS.

Timber Harvest Planning and Operating Ground Rules require timber operators to protect special features through detailed harvest planning and careful operations. (e.g., riparian buffers, steep slopes, sensitive sites, cultural/heritage sites, areas with high aesthetic value and may be deleted from the net landbase.)

Disposition holders shall complete Variance Table 1 and Variance Table 2 as they monitor the operational implementation of their plans against the SHS. The format of the tables may be changed based on discussions between the area and the company as required fields may vary regionally.

Definitions:

Deletion – SHS area removed from the active landbase for at least one rotation. Only deletions of 2 ha and greater will be classified as variance and reported in the FHP and GDP. Examples of deletions include watercourse buffers, protected areas, inoperable ground, unmerchantable stands, land use deletion, and other.
Deferred – SHS area deferred from harvest until after the 10 year SHS timeframe. These stands can still be harvested in the future and can only be treated as a deferral if there are other similar stands in the area to return to harvest during the next planning cycle. Only deferrals of 2 ha and greater will be classified as variance and reported in the FHP and GDP.

Variance – Is any deletion or deferral from the SHS to the laid out harvest design as shown in the FHP.

Sliver – Operational deviation from the SHS that is less than 2.0 ha (and not tracked as variance) and adjacent to the SHS polygon. If it is not adjacent (a stand-alone polygon), it must be tracked as an addition or variance regardless of size. Total area that meets the sliver definition must be submitted in FHP and GDP variance reports.

Total SHS Area - Is defined as the total SHS area within the FHP.

SHS Area Harvested - Is the planned and harvested area in the FHP.

Additions - Area not part of the 10 year SHS that is added to the FHP harvest area. Area can only be added to the SHS polygon during layout when an equal or greater amount of the same stratum has been identified and tracked as variance. The sum of total area to be harvested and total area already harvested cannot exceed 100 percent of the SHS area/subunit without moving to appraisal of the FHP. Only additions of 2 ha or greater will be reported.

Stratum - The yield stratum used in the FMP timber supply analysis.

Compartment - Operational subunits of a forest management unit (FMU) delineated by environmental, operational or watershed characteristics.

GROUND RULES

4.1.1 Companies shall submit a map to show the comparison of the SHS to the laid out FHP highlighting all deletions and additions.

4.1.2 Companies shall submit a cumulative spatial harvest sequence variance monitoring report as per the Upper Hay SHS manager (see 4.1.5). Additions and variances equal to or greater than 2 ha shall be reported with each FHP submission by compartment. Each compartment report will track additions and cumulative variance for all FHPs in the compartments.
4.1.3 Alberta will appraise any plan exceeding the thresholds set out in 3.4.1 to determine the need for a compartment assessment per section 3.2.

4.1.4 Stands currently not part of the net landbase that are found to be productive merchantable landbase may be considered for addition with Alberta’s approval.

4.1.5 The GDP (as-built) will contain the cumulative variance and planned and harvested SHS area for all compartments within the FMA.

4.2 TREE UTILIZATION

PURPOSE

To utilize all merchantable trees and pieces in a merchantable stand as defined by the timber disposition and the FMP.

DISCUSSION

Tree utilization assumptions in the FMP must be followed so that sustainability is not affected.

GROUND RULES

4.2.1 The tree/piece utilization standard is stated in the applicable timber disposition and shall normally be one of the following standards.

Coniferous Utilization Standards

15/10 Utilization

- Merchantable Tree: one that has a minimum diameter of 15 cm outside bark at stump height (30 cm) and a usable length of 4.88 m to a 10 cm diameter (inside bark).
- Merchantable Piece: one that is 2.44 m or longer, with a 10 cm (inside bark) small end, where rot content or form does not render it unusable.

15/11 Utilization
• Merchantable Tree: one that has a minimum diameter of 15 cm outside bark at stump height (30 cm) and a usable length of 4.88 m to a 11 cm top diameter (inside bark).

• Merchantable Piece: one that is 2.5 m or longer, with an 11 cm (inside bark) small end, where rot content or form does not render it unusable.

Deciduous Utilization Standards

15/10 Utilization

• Merchantable Tree: one that has a minimum stump diameter of 15 cm outside bark and a merchantable length of 4.88 m or greater to a 10 cm top diameter (inside bark), or to the point where the stem is unusable or there is no central stem due to heavy branching.

• Merchantable Piece: one that is 2.44 m or longer to a 10 cm (inside bark) small end, where rot content or form does not render it unusable.

Salvage Operations

19/13 Utilization

• This standard may be adopted by Alberta to encourage recovery of timber damaged by natural agents in coniferous and deciduous stands.

• Merchantable Tree: one with a minimum diameter of 19 cm outside bark at stump height (30 cm) and a merchantable length of 5.0 m or greater to a 13 cm top diameter (inside bark).

• Merchantable Piece: one that is 2.44 m (plus 5 cm trim allowance) or longer, to a 13 cm (inside bark) small end, where rot content or form does not render it unusable.

4.2.2 Coniferous and deciduous log butts or large ends exhibiting advanced decay greater than 50% in area of the cut surface may be bucked at 0.61 m intervals or less to 50% sound wood.

4.2.3 Maximum stump height when measured from ground level shall be no more than 30 cm or that used in the TSA for the FMP (e.g., 15 cm). Exceptions may be approved in the FHP (e.g., to delineate harvest areas, create rub posts for understory protection). Where stumps are left to delineate areas (e.g. harvest areas, create rub posts for understory protection, or to delineate poorly defined watercourses) they shall be no less than 30 m apart and no higher than 2 m.

4.2.4 As per the Debris Management and Structure Retention ground rules, forest operators are permitted to leave merchantable volume in harvest areas if the approved FMP identifies specific stand structure retention strategies. In the absence of FMP guidance, the standards in section 7.4 of this annex apply.

4.2.5 All trees/pieces used in the construction of crossing structures may be scattered or piled along the ROW or in the harvest area, but they shall not be piled in riparian areas.

4.2.6 Company processing practices cannot make an unmerchantable piece from a merchantable tree or merchantable piece.
5.0 INTEGRATION WITH OTHER USERS

5.1 DECIDUOUS/CONIFEROUS INTEGRATION

**PURPOSE**

To ensure that planning, harvesting and reforestation in overlapping dispositions are carried out efficiently and with a minimum of environmental impact.

**DISCUSSION**

Due to overlapping tenures, integration of activities between the various operators is essential. Alberta monitors the integration of roads and harvesting, but the responsibility for coordinating plans and operations lies with the operators.

Integration of activities is necessary to:

- a) reduce the amount of time roads are open;
- b) reduce disturbance of wildlife;
- c) enable prompt reforestation.

**GROUND RULES**

- **5.1.1** All operators with timber dispositions in an area covered by an FHP/GDP must agree to the FHP and GDP before approval is granted. If agreement cannot be reached after all meaningful consultation has taken place, the following dispute resolution process can be implemented. Areas of disagreement will be documented and forwarded to the senior forester for review with the reviewing forester. Depending on the exact nature of the disagreement, Alberta will either: 1) facilitate a dispute resolution process; or 2) direct the operators on areas of disagreement through conditions of approval. If either proponent disagrees with the determination of the senior forester, they may appeal the decision to the area manager for a decision.

- **5.1.2** All roading, harvesting and silviculture operations shall be completed at a time and in a manner that enables effective reforestation and minimizes road access.

5.2 FOREST RECREATION AND TOURISM

**PURPOSE**

To manage the implications of forest management activities on forest recreation.

**DISCUSSION**

Forest management activities can impact recreational opportunities. Potential exists for increased public awareness and for increased recreational opportunities through co-ordination with forest management practices. The FMP shall have addressed recreational issues through a variety of tactics such as deferrals or buffers around specific sites or access management strategies.
GROUND RULES

5.2.1 Operational tactics to mitigate impacts on recreation and tourism shall be described in the FHP.

5.2.2 The forest operator shall work with groups that have raised concerns with the operator or have been identified by Alberta.

5.2.3 Roads should be planned to avoid recreation areas. Roads shall be designed to ensure they can be used safely while minimizing their impact on the recreation values of the area.

5.2.4 FHPs within recreational sites shall provide opportunities for the enhancement of existing recreational trail and road systems whenever possible, while adhering to the provincial Motorized Access Management Policy on Industrial Dispositions.

5.2.5 Roads shall be posted with appropriate traffic control and cautionary signs when timber harvesting or hauling operations are in progress.

5.3 TRAPPING

PURPOSE

To avoid damage to the infrastructure associated with registered fur management areas (RFMA) and to reduce the impact on trapping opportunities.

DISCUSSION

Communication with the owner and/or operator of a trapline is a key element in minimizing the impact of forest operations. Discussions held early in the planning process allow both the trapper and the forest operator to work co-operatively, with the least amount of disruption to their individual operations. Upon request, the local Fish and Wildlife office shall provide the relevant list of trappers to the forest operators before January 1 of each year.

GROUND RULES

5.3.1 A representative of the forest operator shall personally contact, or send a registered letter to the senior partners of an RFMA during the preparation of the FHP. Information such as cabin locations, trails and other improvements, or concerns shall be noted at this stage. During the development of the FHP, information and concerns shall be integrated into the plan. The forest operator shall provide the trapper with a copy of the approved FHP map.

5.3.2 At least ten days prior to commencing operations, the forest operator shall notify the trapper, preferably by personal contact, that timber operations are beginning in the RFMA.
5.4 RANGE MANAGEMENT

PURPOSE

To integrate forest and range management operations in a manner that optimizes the benefits derived from both activities.

DISCUSSION

The goal is to develop a co-operative, long-term relationship between grazing disposition holders and forest operators to sustain fibre and forage resources.

At the GDP, FHP and AOP stages of planning, the emphasis is to integrate harvesting, silviculture, and grazing schedules to ensure the sustainability of timber, forage, wildlife and watershed values (i.e., wildlife habitat, watershed protection). Specific harvesting and reforestation operations and grazing systems would be identified within components of the AOP.

Effective communication between the timber and grazing operators is necessary. Discussions held early in the planning process are intended to enable the grazing disposition holder and the forest operator to work co-operatively minimizing the disruption to their individual operations. Alberta has developed standards to guide the integration of timber and grazing. These standards will be used by the two industries to ensure effective communication and integration is occurring on overlapping dispositions.

GROUND RULES

5.4.1 The forest operator shall conduct all operations in accordance to the Grazing Timber Integration Manual.

5.4.2 The forest operator has ensured that timber operations do not negatively impact the range management of the grazing disposition. Examples of these impacts include: damage or disruption to range improvements, infrastructure, roads, and bridges (e.g., fencing, water developments). The forest operator is responsible to repair and/or replace any damage to these improvements and infrastructure.

5.4.3 The forest operator has contacted the grazing disposition holder in person or by phone a minimum of 10 days prior to commencing timber operations to discuss access and any other issues affecting the range management of the grazing disposition.

5.5 FOREST AESTHETICS

PURPOSE

To manage the visual impact of timber operations on the forest landscape.

DISCUSSION

The objective is to mitigate the impact of timber operations on the visual quality of the forest landscape by:
• identifying the location of forest landscapes and other areas of high visual and scenic value, and setting objectives for their management;
• addressing visual quality issues in the FMP.

Areas considered highly sensitive are those:

a) within, adjacent to or viewed from recreational sites and tourist developments;
b) seen from elevated viewpoints;
c) adjacent to or viewed from major travel corridors (roads, lakes, and rivers), rural/urban forest interface and site-specific areas identified during the referral and public review process;
d) adjacent to primary and secondary highways in Alberta.

Tactics to reduce the impacts of timber harvest and reforestation on visual quality may include: retention of forest structure and lesser vegetation at strategic vantage points in the harvest area, modification of harvest area design, low impact scarification techniques, vegetative buffers, and utilizing natural topography.

GROUND RULE

5.5.1 Highly Sensitive areas shall be assessed and tactics shall be employed in the FHP to mitigate the impacts of harvesting and reforestation on visual quality.

5.6 HISTORICAL RESOURCES

PURPOSE

To ensure that forest operators identify and protect historical resources.

DISCUSSION

There are many thousands of historical resources (i.e., archaeological and paleontological sites), located on Alberta’s Crown land. In keeping with the requirements of Alberta Culture and Community Spirit, forest operators shall develop and implement a process for identifying and protecting resources that are regulated by the Historical Resources Act.

GROUND RULES

5.6.1 All known historical resources, and lands on which they are likely to occur shall be identified and managed in keeping with the requirements of Alberta Culture.

5.6.2 Historical resource records are confidential and shall not to be shared with the public.

5.6.3 If a previously unknown historical resource is discovered during road building, harvesting, or silviculture operations, the operations that may directly affect the historical resource shall cease and the Heritage Resource Management Branch of Alberta Culture shall be notified.
6.0 WATERSHED PROTECTION

PURPOSE

To manage the implications of forest operations on water quality, quantity, and flow regime by:

- minimizing the potential for sedimentation in watercourses;
- preventing soil, logging debris and deleterious substances from entering watercourses;
- maintaining aquatic and terrestrial habitat;
- complying with the Water Act.

DISCUSSION

The FMP shall address watershed water quantity and flow issues. Ground rules define operating practices to protect water quality and riparian values.

Riparian areas adjacent to watercourses and water source areas regulate stream flows (storage and release of surface and groundwater), reduce sheet, rill and gully erosion, moderate stream temperature, provide bank stability and cover, provide sources for in-stream debris to create aquatic habitat, provide habitats supporting a high diversity of wildlife species and other biota, and help establish landscape corridors or habitat connections.

Authorizations by Alberta do not imply authorization under federal legislation and requirements, notably the federal Fisheries Act. The proponent must seek advice and approvals of the federal agencies (Department of Fisheries and Oceans) regarding federal legislation requirements.

GROUND RULES

6.0.1 Watercourses shall be classified according to Table 1, Watercourse Classification. In the event the channel classification is not distinctly evident, the width shall be determined by the average of measurements taken at 50 m intervals over the length of the watercourse adjacent to or within the harvest area. Where the distance is not sufficient for two measurements, reduce the measurement interval distance to 25 m.

6.0.2 Where an approved FMP does not provide an estimate of increased water yield, the following applies. Watersheds shall not be unduly affected by large harvest areas or harvesting large amounts of timber in a watershed unless otherwise approved in the FMP. Predicted water yield increases should not exceed 15% within third-order streams. Companies will report the predicted increase in water yield annually in a mutually agreeable format.

6.0.3 Measures must be implemented, including temporary and permanent erosion control measures, to minimize erosion and sedimentation into the watercourse or waterbody.

6.0.4 Riparian protection areas shall be established as in Table 2, Standards and Guidelines for Operating beside Watercourses. Where uncertainty exists on the classification of the watercourse, the watercourse protection area shall be that required by the higher class of watercourse.

6.0.5 All unmapped or incorrectly classified watercourses encountered during operations shall be given the appropriate protection as described in Table 2.
6.0.6 Unless otherwise approved in a FMP, variances from the standards in Table 2 must demonstrate that aquatic and terrestrial objectives are met. Any such proposals shall undergo a full review by Alberta prior to being considered for approval.

6.0.7 Sediment, logging debris or deleterious materials (e.g., fuels, oils, greases, industrial or household chemicals or refuse) shall not be deposited into the water or onto the ice of any watercourse or water body during road construction, harvesting, reclamation or silviculture operations.

6.0.8 Equipment shall cross watercourses only at approved crossings.

6.0.9 Logs shall not be decked in watercourses, riparian areas, or seepage areas.

6.0.10 Authorized in-stream activities in fish-bearing watercourses shall be scheduled to avoid disturbing migration, spawning and incubation of fish species, and carried out in such a manner as to avoid stream sedimentation.

6.0.11 Beaver ponds shall have same classification as the watercourse flowing out of the pond as measured at a representative width within 50 m of the dam.

6.0.12 Harvesting is not permitted within water source areas during non-frozen periods.

See Water Act for definitions of class A and B waterbodies.
7.0 HABITAT MANAGEMENT

7.1 LANDSCAPE PLANNING AND HARVEST AREA DESIGN

PURPOSE

To implement forest operations in a manner that ensures landscapes maintain biodiversity and ecosystem function.

DISCUSSION

Forest operators are expected to manage the forest cover in a manner that maintains biodiversity and ecological integrity. The SHS approved in the FMP is the mechanism by which the forest cover is managed.

Within landscapes managed for timber production, landscape patterns, cover types and seral stages can be managed to produce a desired future forest. The coarse filter approach to maintaining biodiversity in managed landscapes involves managing for suitable amounts and patterns of all forest cover types and all seral stages, along with managing for inherent natural spatial and temporal variability.

The variability of natural disturbances shall be considered when planning harvest area size and shape. This variability will help to provide habitat for species that are dependent on natural disturbance regimes. The use of Alberta vegetation inventory (AVI) polygon boundaries will help to plan this variability. Use of natural features as harvest area boundaries is consistent with natural disturbance and shall be used whenever possible.

Landscape planning requires that targets be set that are measurable. Targets describe the amount of each landscape element that will be created, maintained, or managed, as well as the spatial and temporal variability (expressed as a range) of each. Creating variability in natural landscapes is important because element amounts vary between landscapes, and the requirements of biota also vary. Targets will be refined over time using analysis based on natural disturbances, natural succession processes, current and historical conditions within the region, sub-region and ecodistrict or ecoregion.

Wildlife species of special management concern are major considerations in the selection of the SHS in the FMP.

Wildlife movement corridors are required to ensure that animals with large home ranges find passage between and within managed landscapes. When planning for wildlife habitat and movement corridors, the following factors shall be considered: watercourse classification/profile/pattern and associated valley definition, timber types and proximity to watercourses, travel corridor width, harvesting method, harvest area shape, continuity of forest cover or adjacency/size of forest patches.

GROUND RULES

If not otherwise addressed in an approved FMP, SHS or structure retention strategy, the following ground rules shall apply:

7.1.1 Adjacent watersheds of small permanent watercourses shall have wildlife corridors connecting their uplands. This corridor should be focused on natural travel corridors and may contribute towards structure retention targets.
7.2 HARVEST AREA DESIGN AND LAYOUT

PURPOSE

To provide direction for designing harvest areas.

DISCUSSION

Detailed planning of harvest areas must address reforestation, wildlife habitat (e.g., line of site, hiding cover, sensitive sites), watercourse protection, integration with other land uses, understory protection, structure retention, road development and reclamation, and visual quality.

The following items affect harvest area size and shape:

- current inventory polygon boundaries;
- tree species, age and silvicultural characteristics;
- habitat requirements of species of management concern and species at risk;
- key wildlife zones;
- amount and distribution of non-productive lands and immature treed lands;
- location and size of watercourses and buffers;
- location of roads, pipelines and power lines;
- topographic features;
- presence of viable understory;
- retention of shrub and tree patches;
- accessibility to all or part of the compartment;
- potential blowdown of peripheral and within-harvest area trees;
- visual sensitivity.

GROUND RULES

7.2.1 Line of sight shall be minimized where harvest areas are adjacent to accessible permanent Class I, II or III roads. Targets for the limits of sight distance shall be 400 m, but may be exceeded if well justified in FHP.

7.2.2 Roadside vegetation shall be protected in harvest areas to limit the line-of-sight distance across the harvest area. To minimize breaks in the vegetation screen, only one road entry point shall be commonly allowed into the harvest area.

7.2.3 Direct distance to wildlife hiding cover should not exceed 200 m.

7.2.4 Timber harvesting shall not occur on any area where the likelihood of soil water table increases following harvesting is high, and the associated reforestation success is compromised.

7.2.11 Buffers as required in 7.7.6.2, 7.7.4.1-4, and section 6.0 shall be maintained.

7.2.12 Practices required by other disposition holders must be implemented. (e.g., pipeline crossings, road use agreements, operating constraints around power lines).
7.2.13 Understory protection standards in section 7.5 must be met.

7.2.14 Structure retention standards in section 7.4 must be met.

7.2.15 Tactics to address visual quality concerns (section 5.5) must be implemented.

7.2.17 Alberta PSPs shall not be disturbed or harvested unless such action is approved by Alberta. These plots shall also be protected from blowdown.
7.3 DEBRIS MANAGEMENT and Wildfire Protection

PURPOSE

To manage the amount and distribution of woody debris left in harvest areas to:
- minimize wildfire risk, particularly near communities;
- optimize ecological benefits;
- minimize the loss of productive landbase.

DISCUSSION

Debris or slash accumulation resulting from timber harvest operations must, as a priority, be redistributed or disposed of to minimize the risk of wildfire ignition and spread. However, it is recognized that some retention of debris is valuable from an ecological perspective, and that a reasonable amount of debris retention shall occur to emulate natural forest floor accumulations. Ecological benefits include microtine habitat, furbearer habitat (when piled), and soil nutrient inputs. When debris is maintained, it must be in such a distribution and amount to: 1) minimize wildfire risk as a priority, 2) minimize the amount of productive landbase loss by limiting lost area available for deciduous species suckering, or tree planting, and 3) provide ecological benefit (coarse filter vs. fine filter).

Acceptable methods of reducing slash hazards are defined in Appendix 2, Management Standards for Timber Harvest Operations (Directive 2007-02).

Landscape-level issues regarding the risk of large fires are addressed in the development of the SHS. The FMP shall develop objectives, strategies and tactics that consider the risk of occurrence and spread of fire at the stand and landscape levels.

Opportunities may exist to implement fuel reduction, isolation and conversion on the landscape while accounting for other values. Where applicable, forest operators shall follow the guidelines in the FireSmart Protecting Your Community from Wildfire manual.

GROUND RULES

Debris Management Ground Rules

7.3.1 Slash accumulations resulting from timber harvesting, road, and campsite construction shall be disposed of within 24 months in a manner acceptable to Alberta.

If the strategy involves random scattered piles throughout the harvest area
a) height of piles must not exceed 2 m;
b) base diameter of piles must be no greater than 3 m;
c) distance between piles must be no less than 25 m;
d) distance from block edge must be no less than 25 m.

7.3.2 Slash fuel accumulation is not permitted within 5 m of the perimeter of the harvest area. The bordering undisturbed forest floor shall be used as a benchmark to determine what constitutes a significant accumulation. Unacceptable accumulations include piles of trees or non-merchantable timber, and tops or branches deposited during logging that could create fuel ladders for fire bordering the stand.

7.3.3 Piling and burning operations shall:

a) not be conducted during the fire season, unless otherwise approved in the Fire Protection Plan in the AOP;
b) require a post burning survey to ensure all holdover fires are extinguished.

7.3.4 The FHP shall follow direction from firesmart community plans.

7.3.5 The forest protection plan of the AOP shall contain the following:

a) duty roster;
b) list of company woodlands personnel and their fire control training;
c) key company contacts;
d) heavy equipment resource list;
e) small hand tool resource list and their location;
f) company communication system and numbers and call-signs;
g) fire prevention policies;
h) fire prevention strategies;
i) fire prevention priorities (high values at risk);
j) fire operations schedule (i.e., harvesting and silviculture activities within the fire season);
k) identification of barriers to fire spread.

7.4 STRUCTURE RETENTION

PURPOSE

To create temporary refuges for forest biota to re-colonize harvest areas.
To maintain snags and live residual trees in harvested areas for biota that depend on these structures following natural disturbances.
To provide wildlife thermal and hiding cover within harvest areas throughout the rotation.
To provide wildlife travel corridors within large harvest areas and compartments.

DISCUSSION

Although many types of natural disturbance (fire, floods, avalanches, wind events, insect and disease infestations, and slumps) occur within Alberta’s forests, fire is the most common. Virtually all trees within intense fires are killed, but following low and moderate-intensity fires many scattered live trees are present. In addition, within all fire types, fire “skips” or “islands” result in residual patches of live trees remaining within larger burned areas. Following other types of natural disturbances, even higher densities of live trees, and patches of live trees, are present. Approximately 30% of the birds and mammals living in Alberta’s forests nest forage or find shelter within live trees that have a basal diameter greater than 20 cm. Many of these species are able to use single large live trees and residual patches of large live trees that remain after natural disturbances.

The retention of single trees and patches of large live trees in harvest areas makes the harvested areas more similar to burned areas. In addition, residual live trees may create some old forest attributes in young regenerating harvest areas. Many of the birds, mammals, insects, beetles, fungi and nonvascular plant species that live in recently disturbed forests require large snags for food and shelter. This unique biotic community changes rapidly as the snags fall and the downed logs are incorporated into the forest floor. Some biota become rare within ten years following a fire, and many of the early colonizing species have disappeared by the time the stand is twenty years old.

Retaining some large snags within harvest areas creates habitat for some biota associated with naturally disturbed habitat. Additional large snags may be created, by retaining large live trees, as some of these trees will die throughout the rotation. To a large extent, however, it will be necessary to rely on natural disturbances to create abundant large snags for biota that depend on this dead woody material.
Where larger harvest areas are created, it is important to retain a number of individual trees, snags and residual tree patches distributed across the harvest area. These residual tree patches shall be located such that natural features, riparian areas, wildlife features, stand structure and composition, and proximity to standing forests are taken into account to maximize their utility or usefulness by the biotic community.

These ground rules describe the average number of patches per hectare of residual material that will be left within harvested areas of a landscape unit for those where this is not defined in a FMP. There may be zero patches of residual structure in any particular harvest area as long as the amount identified in the TSA is met across the landscape over time.

Current information suggests that ecological benefits are directly proportional to the amount of structure retention; ecological benefits increase with greater levels of structure retention. Larger patches of residual structure generally have more benefits than smaller patches (lower blowdown probability, interior forest characteristics, hiding and thermal cover) and patches generally have more benefit than individual stems.

GROUND RULES

7.4.1 Residual structure shall be retained in harvest areas during harvest and silviculture operations (including salvage operations) according to the FMP regarding the amount of structure, size of patches, species, composition, and distribution. In the absence of direction in the FMP, the following standards apply.

7.4.2 The following table describes the average number of patches of residual structure that shall be left within harvest areas. The average number of patches per hectare shall be calculated and implemented at the compartment level. There may be zero patches if residual structure in any particular harvest area as long as there is compensation in other harvest areas to meet the compartment average. There is an acceptable variance of 10% of total area in residual structure by harvest area size class for the compartment.

<table>
<thead>
<tr>
<th>Harvest Area Size</th>

<td>Small Patch</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>Large Patch</td>
<td>0.2</td>
</tr>
</tbody>
</table>

7.4.3 Forest operators shall retain structure in the following manner:

a) leave larger patches rather than multiple smaller patches;
b) leave individual stems of residual structure throughout harvested areas, as available;
c) leave as many individual stems of non-merchantable trees, shrubs and snags as operationally and silviculturally feasible;
I. leaning snags or trees of non-merchantable species that are greater than
6 m in height that create a safety hazard may be felled to create safe working conditions.

II. Snags within 40 m of roads, camps, landings, fence lines, power lines and machine maintenance areas may be felled to create safe working conditions

d) unsalvaged burnt areas may be used to meet residual structure objectives (i.e., averages) within a compartment.

7.4.4 The following are guidelines for the spatial distribution of residual structure:

a) retain residual structure near woody debris piles (and vice versa);

b) retain residual structure near the harvest area boundary to create a gradual ecotone between the harvest area and un-harvested forest;

c) retain residual structure in patterns and locations that minimize the potential for blowdown;

d) retain residual structure near ephemeral draws and intermittent streams;

e) retain residual structure within inoperable areas whenever possible.

7.4.5 As per 4.2.3, forest operators may create stubs within the harvested area to supplement snag densities, aid in wind-firmness of residual patches or for use as rub posts.

Structure Retention Guidelines Specific to FMU F26.

7.4.6 Merchantable and non-merchantable structure shall be retained in harvest areas during operations (including salvage operations).

a) An average of 1% of the merchantable coniferous and 1% of the merchantable deciduous volume shall be retained within harvest areas across the landscape.

b) The amount and species of merchantable structure retained within individual harvest areas and compartments will vary between 0-3%.

c) An average of 5% of the total area harvested across the landscape shall be retained as residual material. Residual material, where it exists on the landscape can include lesser vegetation, standing dead, broken, or decaying trees, trees identified as having dens or nests, viable understory, or other unique flora and/or terrain features.

7.4.7 Variability in the amount and composition of merchantable retention across the landscape will incorporate other values and objectives (e.g., forest health, visual aesthetics, etc.).

7.4.8 Merchantable retention shall be focused in harvest areas which exceed 100 ha or those harvest areas in which the direct distance to hiding cover exceed the threshold outlined in 7.2.3 and shall be emphasized in areas where multiple canopy layers and a range of tree sizes and species exists.

7.4.9 Proximal retention can be utilized for wind firming stands, protection of understory or for defined purposes/values (TLU, sensitive sites, etc.) and must be identified in the FHP. Proximal retention can be considered provided:

a) area of retention touches the boundary;

b) retention area cannot make up more than 30% of the total retention target per FMU level by quadrant;

c) area is not part of a stream buffer;
d) retention area must be excluded from being sequenced for at least thirty (30) years from the skid clearance of the associated opening; and

e) all other applicable retention requirements apply as per section 7.4.

7.4.10 The company shall measure, report and charge structure retention to the appropriate disposition in a manner acceptable to Alberta.

7.5 UNDERSTORY PROTECTION

PURPOSE

To protect coniferous understory during timber harvesting and reforestation operations.

DISCUSSION

The main objective of this ground rule is to protect coniferous understories (understory) that will contribute to future forest values. Techniques will vary depending on whether the stand is defined as coniferous or deciduous landbase.

Two understory protection techniques are considered:

- **Avoidance** – Used in low density stands and/or highly aggregated (clumped) understory distribution. Wind buffering tactics and pre-planning not specifically required.

- **Protection** – Wind buffering tactics utilizing structure retention, pre-planned strip harvest/skid trails.

In both understory protection techniques, 50% of the acceptable trees in the understory must be retained without harvest damage.

The following factors shall be considered when planning for protection of understories:

1. **Understory Characteristics**: species, density and height, the health and vigour of the understory, the size and wind permeability of the crown, height-diameter ratio (slenderness coefficient)

2. **Site Conditions**: soil conditions that may limit rooting (e.g., depth to water table), topographic features that may enhance or diminish wind-firmness, adjacent stand features and impacts on understory wind firmness.

The SHS shall specify stands with understory sequenced for harvest.

GROUND RULES

7.5.1 The FHP shall specify harvest areas for understory protection vs. avoidance techniques. Detail on protection techniques shall be described in the FHP harvest area comments and detailed harvest area plans (DHAPs).

7.5.2 Understory discovered in the field, but not previously identified at the FHP stage, will be subject to the same strategies as stated in the FMP.

7.5.3 A minimum of one half (50%) of the total number of acceptable stems (preharvest) in an understory shall be retained without harvest damage. Blocks with avoidance techniques and low density evenly spaced understory may achieve less than 50% protection. These blocks must be identified in the FHP before approval will be given.
7.5.4 Where operating on a dissolved landbase, understory protection shall be practiced in stands where agreed to by both operators. Understory avoidance shall be practiced throughout the remainder of the landbase. Where operating outside of a SHS, understory protection shall be practiced on stands with greater than 500 stems/ha of acceptable stems where avoidance techniques cannot protect at least 50% of the acceptable stems.

7.5.5 Priority will be to protect acceptable stems that are 2 m or more in height, are within 75% of the average understory stand height, have 50% or more live crown, are of good health and vigour, and are crop trees as defined by the survey manual. Understory not meeting these specifications can be protected to meet other values.

7.6 FISHERIES AND THE AQUATIC ENVIRONMENT

PURPOSE

To conduct timber operations in a manner that shall minimally affect:
- the health, diversity and natural distribution of aquatic biota;
- the quantity and productive capacity of the aquatic environment, including fish habitat, and;
- fisheries management objectives identified in the FMP.

DISCUSSION

Current provincial and federal legislation require that the aquatic environment and fisheries resources in Alberta must be protected.

Timber operations can directly affect the aquatic environment and fish habitat in a number of ways. Tree removal in riparian areas and along stream banks can alter light intensity, nutrient supply, sediment inputs, water temperatures, stream bank stability and recruitment of large woody debris to the watercourse. Watercourse crossings, if not properly designed, can create physical barriers to the movement of fish and other aquatic biota along watercourses. Roads and ditches can intercept and transport sediments from the upland source to crossing sites where they are deposited in the watercourse. Upland timber harvesting can also affect watershed water yield and flow regimes. These effects can lead to changes in aquatic primary productivity, food-web pathways, aquatic species abundance and distribution, and channel morphology.

The primary strategy for maintenance and protection of the aquatic environment and fish habitat values is to maintain treed buffers along watercourses and water bodies and adopt rigorous watercourse crossing and erosion control measures. Alternate management of riparian areas would be considered in certain situations to support aquatic environment and fisheries management objectives in the area.

Authorizations by Alberta do not imply authorization under federal legislation and requirements, notably the federal Fisheries Act. The proponent must seek advice and approvals of the federal agencies (Department of Fisheries and Oceans) regarding federal legislation requirements.

Additional ground rules for any work carried out in and around watercourses are found in section 11.4 – Watercourse Crossings.

GROUND RULES

7.6.1 All waterbodies and watercourses are presumed to be fish bearing or support fish-bearing habitat. However, the company may confirm the distribution of fish and fish habitat within the planning areas by:
- checking the Fisheries and Wildlife Management Information System (FWMIS), Water Act Codes of Practice and past inventory data;
- conducting new inventories; or
- consulting with the appropriate Area Fisheries Biologist.
7.6.2 For assessment requirements and methods, refer to Schedule 4 of the Code of Practice for Watercourse Crossings.

7.7 SPECIES OF SPECIAL MANAGEMENT CONCERN

PURPOSE

To conduct planning and timber operations in a manner that shall:

- conserve and plan for an agreed upon level of effective habitat for species of special concern including woodland caribou, grizzly bear, trumpeter swan and others as determined by Alberta from time to time;
- maintain the effective habitats for ungulates in river valley environments.

GROUND RULES

7.7.1 Woodland Caribou, Grizzly Bear, and Ungulate Habitat in Major River Valleys

7.7.1.1 To the extent possible, all new access roads must follow existing disturbances, unless doing so will compromise options for subsequent access management (i.e., “traditional access” issues).

7.7.1.2 Preference shall be given to development and use of winter (frozen ground) roads since this reduces negative impacts on wildlife, permits minimization of long-term infrastructure, and facilitates reclamation.

7.7.1.3 It is recognized that in some cases work will occur throughout the winter season to take advantage of frozen ground access. Frozen ground operations using frozen ground roads take precedent over early-in/early-out. Completing operations in ungulate habitat areas early in the winter season remains a management objective.

7.7.1.4 As an alternative to winter (frozen ground) roads, summer roads may be developed and used, subject to the following:

a) road width and grade shall be minimized. Preferentially, summer roads shall be temporary “dry weather” routes, with use suspended when ground conditions are unfavourable;
b) summer harvesting areas shall preferentially be located outside of caribou and grizzly range as well as outside of ungulate habitat in river valleys, or as an alternative, in proximity to previously existing all-weather access roads to assist in reducing the need for new summer access routes. As an alternative, summer harvesting in more remote areas shall have hauling deferred to take advantage of frozen ground conditions.

7.7.1.5 Except where identified and agreed upon within the FHP, only temporary access roads shall be used.

7.7.1.6 Roads shall be built no sooner than one year prior to harvesting operations. Temporary roads shall be re-contoured and reclaimed (and potentially reforested) within 18 months of completion of harvesting and hauling operations, unless otherwise agreed to in the operating schedule.
7.7.1.7 As agreed to between the company and Alberta, effective forms of public access control for highway vehicles shall be maintained. Control of highway vehicle use of any open temporary or permanent access route may be required. All “non-traditional” access routes that are open must have measures in place to prevent highway vehicle traffic. Options for access management on “traditional” routes must be considered during the CA or FHP. The need for options to manage off highway vehicle traffic must be considered in the CA or FHP (see section 11.5 for more detail on Access Management).

7.7.1.8 Reclamation techniques used on access routes must strive to prevent highway vehicle use and limit off-highway vehicle use.

**Woodland Caribou**

**DISCUSSION**

The FMP strategies and SHS shall describe the harvesting program that will create the desired future forest, taking into consideration the full range of values including habitat for species of special concern.

Woodland caribou are classified as a “Threatened” species under both the Alberta Wildlife Act and the National COSEWIC/RENEW system. The Federal Species at Risk Act (SARA) shall apply to woodland caribou in Alberta. The “1996/97 Operating Guidelines for Industrial Activity in Caribou Ranges in West Central Alberta” and the “2001 Boreal Caribou Committee Strategic Plan and Industrial Guidelines for Boreal Caribou Ranges in Northern Alberta” provide background, intent, and specific direction for managing industrial work on caribou range. Both national and provincial woodland caribou recovery processes have been initiated which may have implications for timber harvesting in Alberta. Woodland caribou range is delineated on provincial land use referral maps.

Timber operations and management in caribou range can affect caribou populations and habitat directly or indirectly and in four main ways: 1) creating and maintaining public access routes, 2) altering natural and human-caused mortality rates on caribou populations (both through access route development and habitat changes), 3) altering the amount, quality, and effectiveness of caribou habitat, and 4) displacing and causing undue sensory disturbance to individual caribou. All of the four factors are consequential for caribou conservation; however, predation rates and habitat changes are of primary concern.

The negative effects of creating and maintaining access routes (public travel, predation, reduced habitat effectiveness, disturbance and displacement) shall be managed by planning the amount, tenure and class of new access routes (roads), and by reviewing and acting upon management options (i.e., access management, abandonment, reclamation) for existing routes.

**GROUND RULES**

7.7.2 Woodland Caribou

7.7.2.1 If not addressed in the approved FMP and SHS strategies, a CA must be completed that addresses the following issues:

a) provide an agreed upon habitat supply forecast including the amount, type, and spatial arrangement of Caribou habitat;
b) the location of all proposed harvest areas;
c) options for partial harvest systems;
d) the amount, alignment, standard (road type) and longevity (tenure) of all access roads;
e) use of, and improvements to existing access roads;
f) access road reclamation plan and schedule, which shall also consider options for reforestation of roads. This shall take into account reclamation options for existing (“traditional”) access routes;
g) measures to achieve public and industrial access management;
h) operating schedule (road construction, harvesting, silviculture);
i) protection of key caribou habitat features (as identified by Alberta and company);
j) terrestrial lichen management strategies (in relation to both harvesting system and silviculture prescription);
k) proposed summer operations.

7.7.2.2 Silvicultural prescriptions shall strive to limit non-coniferous shrub and tree regeneration in habitats dominated by coniferous species prior to harvest, and where regeneration to coniferous-dominant stands is planned. Silvicultural prescriptions shall strive to protect existing terrestrial lichens, and facilitate terrestrial lichen regeneration.

7.7.2.3 A sufficient amount of habitat (considering both habitat quality and effectiveness) must be maintained at all times within the caribou ranges. The FMP shall provide direction of the amount, configuration and location/adjacency of harvest areas and older seral stage retention areas, and on rate of harvest.

7.7.2.4 Harvesting operations shall be “concentrated” spatially within caribou range. Provided green-up requirements are met (unless otherwise approved by Alberta), reserve harvest area harvesting within previously existing two or three-pass harvest designs within caribou range shall occur prior to new harvest areas being opened up.

7.7.2.5 In reserve harvest areas, special consideration must occur during the CA if green-up requirements have not been met or if the resulting post-harvest opening size will exceed 1000 ha. Special planning and operational tactics shall be defined to address potential watershed and reforestation concerns. This could include providing supporting documentation and applying innovative techniques to promote snow catch and reduce impacts of wind exposure.

7.7.2.6 New harvest areas in caribou ranges shall be no larger than 1000 hectares.

7.7.2.7 Structure must be left within harvest areas situated in caribou range, and shall form part of the 1000 ha maximum area of harvest. Retention patches shall be used in large harvest areas to protect areas of concentrated terrestrial lichen growth, and reduce, watershed, aesthetic, and wildlife related concerns.

7.7.2.8 Areas of concentrated terrestrial lichen growth (where terrestrial lichens are the predominant ground cover) within proposed harvest areas must be delineated in the FHP. DHAPs which identify protection measures must be provided to the operator for these areas. Structure retention in harvest areas within the Caribou range should focus on these lichen areas. Alberta may request a review of these plans at any time.
7.7.2.9 Winter operations are preferred to protect existing terrestrial lichen growth within harvest areas, and to retain lichen propagules.

7.7.2.10 Harvest area boundaries shall be based upon natural stand edges, breaks in topography, and other natural features.

7.7.2.11 While maintaining safety, class roads within caribou zones shall have narrower and more temporary road surfaces than those built to road standards outlined in Table 3, (see section 11.1). Table 3A provides guidance towards achieving these objectives. The goal is for development of frozen ground access to minimize grade development.

7.7.2.12 Summer harvesting areas shall preferentially be located outside of caribou range or if within caribou range, be located in proximity to previously existing all-weather access roads to assist in reducing the need for new summer access routes. As an alternative, summer harvesting in more remote areas shall have hauling deferred to take advantage of frozen ground conditions.

Grizzly Bear

Discussion

The SHS and FMP shall describe the harvesting program that is agreed will create the desired future forest, taking into consideration the full range of values including habitat for species of special concern.

Grizzly bears are classified as a “Threatened” species under the Alberta Wildlife Act and as a species of “Special Concern” under the national COSEWIC system. The Federal Species at Risk Act (SARA) shall apply to grizzly bears in Alberta. A provincial grizzly bear recovery process has been initiated which may have implications for timber harvest in Alberta.

Timber operations in grizzly bear range can affect grizzly bear populations directly or indirectly in three main ways: 1) altering natural and human caused bear mortality rates through the creation and maintenance of access routes 2) altering the amount, quality, and effectiveness of grizzly bear habitat, and 3) displacing and causing undue sensory disturbance to individual grizzly bears.

Landscape level planning is necessary to ensure the availability of effective habitat and managing mortality risk for grizzly bears. The indicators of suitable landscape conditions for grizzly bears are habitat effectiveness, security areas, road density and habitat connectivity. Specific strategies for landscape planning for grizzly bear shall be agreed upon in the FMP and at the CA level.

Creating and maintaining access routes have negative effects on grizzly bear populations through increased mortality rates, disturbance and displacement. These negative effects shall be managed by minimizing the amount, tenure and class of new access roads, and by reviewing and acting upon management options (i.e., access management, reclamation strategies for existing routes, avoiding or minimizing access development in critical grizzly bear habitat and by using grizzly bear habitat maps in planning new access).
7.7.3 Grizzly Bear Planning

7.7.3.1 Unless specifically addressed in an approved SHS and FMP strategies, a CA must be completed that addresses the following issues within identified grizzly bear areas:
   a) provide an agreed upon habitat effectiveness (including mortality risk) supply forecast including the amount, type, and spatial arrangement of grizzly habitat. (completion of this forecast is subject to more technical direction from Alberta);
   b) the location of all proposed harvest areas;
   c) the amount, alignment, standard (road type) and longevity (tenure) of all access roads;
   d) use of and improvements to existing access roads;
   e) access road reclamation plan and schedule, which will also consider options for reforestation of roads. This shall take into account options for existing (“traditional”) access routes;
   f) effective measures to achieve public and industrial “highway vehicle” access management;
   g) general operating schedule (road construction, harvesting, silviculture);
   h) protection of key grizzly bear habitat features (as identified by Alberta and company);
   i) berry crop management strategies (in relation to both harvesting system and silvicultural prescription);
   j) proposed summer operations.

7.7.3.2 Companies shall minimize the amount, class, and tenure of roads in identified grizzly bear habitat.

7.7.3.3 Summer roads and crossings should attempt to avoid riparian corridors. Those routes that lie within riparian corridors shall minimize the ROW width and reduce vehicle speeds to 50 km/hr or less through construction standards and company operating procedures.

7.7.3.4 Roads, skid trails, landings and campsites shall be located where they avoid natural meadows and den locations.

7.7.3.5 New road applications in grizzly bear range shall be planned to include a schedule of reclamation and/or deactivation to minimize the establishment of long-term permanent access.

7.7.3.6 The FMP shall provide guidance on the distribution of harvest area sizes.

7.7.3.7 Den sites shall be buffered from harvest area boundaries with a minimum of 100 m.

7.7.3.8 Retention areas should be used in harvest areas to protect areas of concentrated berry growth, and provide hiding cover and connectivity to forest patches.

7.7.3.9 Harvest area boundaries shall be based upon natural stand edges, breaks in topography, and other natural features.
**Trumpeter Swan**

**Discussion**

The FHP shall describe the harvesting program that is agreed will create the desired future forest, taking into consideration the full range of values including habitat for species of special concern.

Trumpeter swans are classified as a “Species of Special Concern” species under the Alberta Wildlife Act. The Recommended Land Use Guidelines for Trumpeter Swan Habitat in Alberta” located on the external website provides background, intent, and specific direction for managing industrial work near trumpeter swan breeding wetlands. Locations of breeding wetlands are found on provincial land use referral maps. A provincial trumpeter swan recovery process has been initiated which may have implications for timber harvest in Alberta.

Trumpeter swans are sensitive to human disturbance, and human activity in breeding areas may decrease survival of eggs or cygnets. Trumpeter swans that are disturbed may not nest or may abandon an existing nest. Therefore, the breeding population continues to be dependent on current management practices and habitat protection.

Timber harvest planning and operating ground rules must reflect the sensitive nature of this species. These operating rules serve three primary purposes:

a) protection of the long-term integrity and productivity of trumpeter swan breeding habitat;

b) avoidance of industrial disturbance to trumpeter swans during nesting and rearing of cygnets; and

c) minimize the access created near swan lakes to reduce the potential for secondary disturbance of trumpeter swans from recreational use.

During the breeding season (April 1 to Sept. 30), low-level (<2000’) aircraft flights may disturb trumpeter swans. Low-level aircraft flights are discouraged over identified trumpeter swan lakes or water bodies.

7.7.4 **Trumpeter Swan**

7.7.4.1 From April 1 to September 30, there shall be no harvesting, hauling, road building or scarification activity within 800 m of the edge of the woody vegetation adjacent to the identified trumpeter swan lakes or water bodies.

7.7.4.2 An area 200-500 m from the edge of the high water mark of identified trumpeter swan water bodies shall be managed in a manner that provides additional protection for the swans. Special measures shall be determined on a site-specific basis during the FHP. Special measures within this zone shall include site preparation that reduces the potential for future vehicular access, no general application of herbicides, and attempts to limit maximum line of sight to 100 m. Attempts to retain sufficient structure to contribute to a “forested” habitat in this zone are encouraged. Techniques that limit line of sight and contribute to the treed buffer of the wetland are encouraged.

7.7.4.3 There shall be no timber harvesting within 200 m of the edge of the woody vegetation adjacent to the identified Trumpeter Swan lakes or water bodies.

7.7.4.4 There shall be no development of long-term infrastructure (roads and camps) within 500 m of the edge of the woody vegetation adjacent to the identified trumpeter swan water bodies. Only seasonal winter routes shall be permitted within the 500 m buffer.
Key Wildlife and Biodiversity Zones

DISCUSSION

The FHP shall describe the harvesting program that is agreed will create the desired future forest, taking into consideration the full range of values including habitat for species of special management concern.

For deer, elk and moose in Alberta, key winter range is often found in river valleys. These landforms contain the topographic variation and site productivity conditions that provide winter foraging conditions in proximity to forest and topographic cover. Also, south-facing valley slopes have relatively lower snow accumulations and warmer bedding sites. The valley landform itself provides protection from high wind chills. Traditional, high use and high quality winter ranges have been identified and mapped on the Wildlife Sensitivity Maps on the basis of several decades of winter aerial population surveys, supplemented by habitat assessments using aerial photo interpretation and ground surveys.

Key ungulate winter ranges play a disproportionately large role, given their localized size and distribution, in maintaining the overall productivity of regional ungulate populations. These ranges ensure that a significant proportion of the breeding population survives to the next year.

Habitat effectiveness, including maintenance of thermal cover, foraging areas and escape cover is important for ungulates. Timber operations within and adjacent to key wintering areas adds stress and increases energy drain for animals. They may be forced to move about unnecessarily and even relocate to less favourable habitat. This becomes an increasingly significant factor as winter progresses. Activities associated with timber harvest may also create temporary and permanent access that exposes animals to additional non-industrial disturbances, increased levels of harvest from licensed and non-licensed hunting, and increased predator efficiency.

In the interest of maintaining productive ungulate populations, operating ground rules must reflect an understanding of the biology of these animals and the importance of their key winter ranges. These must serve two primary purposes: protection of the long term integrity and productivity of key ungulate winter ranges; and avoidance of direct and indirect disturbance to animals that are using these winter ranges during the mid-to late-winter period.

Ground Rules

7.7.5 Key Wildlife and Biodiversity Zones

7.7.5.1 The amount, tenure and class of new access roads shall be minimized and consistent with the land use objectives in regionally defined key wildlife zones (Landscape Analysis Tool (LAT)). Access development will strive to minimize new human infrastructure.

7.7.5.2 The alignment and standard of new long-term and permanent access roads must be identified and agreed upon within the long-term access plan. New long-term and permanent access roads shall not be developed below the valley “breaks” of rivers, except in isolated cases for river crossings.

7.7.5.3 Any proposed new crossings of rivers and creeks must be identified and agreed upon within the Access Management Plan; new permanent crossings shall be avoided.

7.7.5.4 Where possible, all access roads shall avoid known key habitat features.
7.7.5.5 Use of existing access roads must be described in the FHP, with particular reference to public access management, any proposed road improvements and ongoing maintenance. Potential opportunities for partial or complete route closure and/or reclamation following planned harvesting and silviculture shall be discussed.

7.7.5.6 Unless otherwise agreed to in the AOP, timber operations should be conducted outside of the period Jan. 15 to April 30.

7.7.5.7 Mechanical thinning and/or selective use of ground or aerial herbicide as approved by Alberta may occur within this zone.

7.7.5.8 In order to maintain browse availability, mechanical stand tending activities shall only remove competing vegetative growth that interferes with the Reforestation Standard of Alberta (RSA) targets.

**Arctic Grayling**

**DISCUSSION**

The FHP shall describe the harvesting program that is agreed will create the desired future forest, taking into consideration the full range of values including habitat for species of special management concern. Locations of existing arctic grayling can be identified using the Fisheries and Wildlife Management Information System (FWMIS), and the associated Fish and Wildlife Internet Mapping Tool (FWMIT).

Arctic Grayling are classified as a “Species of Special Concern” under the Alberta Wildlife Act. One of the greatest contributing factors threatening arctic grayling related to the forest industry is the density of linear features (e.g., Class I-IV roads, skid trails, and all preexisting access). Development of the FHP must focus on ensuring that best management practices related to construction, maintenance and reclamation of roads is in place, with the primary intent being the protection of fish habitat and productivity. This is achieved through the maintenance of natural hydrologic processes, avoiding erosion, and increasing protection of streams where risks to grayling are identified. The completion of the Alberta Fish Sustainability Index for arctic grayling (ARGR) in 2014 indicates that this species has seen large declines in abundance and distribution throughout the province, disappearing from much of its historical range.

Timber harvest planning and operating ground rules must reflect the sensitive nature of this species. These operating rules serve three primary purposes:

a) protection of the long-term integrity, connectivity, productivity and access of arctic grayling to the spawning, rearing, feeding and over wintering habitat within the watershed;

b) protection of water quality and quantity metrics that provide a key component of the habitat that supports native fish species within watersheds (e.g. temperature, dissolved oxygen content, natural sediment, avoidance of anthropogenic sedimentation and productivity) to ensure the continued occupancy and use of historical watersheds by arctic grayling; and

c) minimize the industrial footprint and density of linear features intersecting watercourses within arctic grayling watersheds to reduce the potential for secondary disturbance and mortality of arctic grayling from recreational use.
GROUND RULES

7.7.6 Arctic Grayling

Within these identified areas:

7.7.6.1 Operational planning by the company should incorporate the use of Alberta’s Wet Areas Mapping tool to identify areas that are sensitive to disturbance. Field confirmation of these sites including depth to water, potential disruption of groundwater flows, and areas at high risk of erosion in wet or riparian areas can be a useful tool in determining road and crossing location.

7.7.6.2 Detailed block plans (DBP) for operations shall be submitted.

7.7.6.3 Unless otherwise approved, all operations should occur outside the restricted activity period (RAP) of April 16 to July 15. Early winter operations are preferred; and during dry or frozen conditions are best.

7.7.6.4 Where crossing of wet areas cannot be avoided, the operator shall ensure that the forest floor remains intact ensuring that normal ground water flows are maintained after reclamation.

7.7.6.5 Site preparation activities within 100 meters of watercourses must minimize soil disturbance to prevent input of sedimentation.
Other Species

Discussion

Additional habitats of selected wildlife species require maintenance of undisturbed habitats (e.g., breeding or denning locations). These species require specific sites in order to complete all or part of their life cycles.

7.7.6 Other Species

7.7.6.1 Sensitive sites listed below shall be protected by retention of an undisturbed, forested buffer (or other management technique) from the edge of the opening associated with these sites, or from the center of sites without openings. Both Alberta and the forest operator shall make a reasonable effort to identify sensitive sites in the FHP. Sites discovered in the field shall receive the same buffer as those sites previously identified in planning. Buffer widths and duration shall be agreed to in the FHP.

7.7.6.2 In the event that site-specific buffers or other management techniques are not agreed to in the FMP and FHP, the following buffer widths shall apply: Where inhabited black bear dens are encountered, the company shall contact Alberta prior to proceeding with operations.

8.0 SILVICULTURE

PURPOSE

To plan and implement silvicultural practices that result in reforested stands that meet yield curve assumptions and management objectives of the FMP.

DISCUSSION

A reforestation program is required by Alberta under timber management regulation (TMR) 143.1. The reforestation program is a component of the AOP and contains reforestation prescriptions by strata, and a schedule of treatments for the upcoming year. The proposed reforestation program provides a link between reforestation operations and the FMP. The reforestation program must be based on the most current knowledge of treatments (by strata) which lead to reforestation success in terms of reforestation standards. Reforestation prescriptions are a critical point in the sustainable forest management planning system where growth and yield strata targets from the FMP are delivered through well-planned silviculture treatments. Knowledge of how sites respond to different treatments result in better treatments, and greater probability of success in meeting growth and yield strata targets, for height, stocking, density and ultimately, strata volumes.

An acceptable silvicultural process includes:

- site assessment (pre or post harvest) based on ecosite classification;
- a prescription table or ‘matrix’ of silviculture treatments or tactics for specific strata;
- regeneration standards based on yield curve strata targets;
- an annual treatment schedule of activities;
- an assessment/survey system and feedback mechanisms to ensure regeneration data is used to refine the prescription matrix and, in conjunction with all data sources (including permanent sample plot information), the regeneration standards and post harvest growth and yield assumptions.

GROUND RULES

8.1 PLANNING

8.1.1 All reforestation program submissions must be validated by a RFP and must contain an analysis of any variances from the silviculture activities approved in the FMP.

8.1.2 The conditions outlined by Alberta must be met prior to planning reforestation of balsam fir or alpine fir as an acceptable species (see Directive 2001-01 or successors).

8.1.3 Harvest layouts bordering previously harvested areas shall be designed to avoid damaging regeneration.

8.1.4 Reforestation timelines prescribed by Alberta shall begin at the start of the timber year following the end of the timber year when the harvest area has received skid clearance from Alberta, or from a company representative pursuant to a self-inspection agreement between the company and Alberta.
8.1.5 Reforestation prescriptions shall be based on site assessments (pre or post-harvest) and shall be specific to ecosites or combinations of ecosites, as defined in the ecosite field guides for Alberta.

8.1.6 The ‘Alberta Forest Genetics Resource Management and Conservation Standards’ (FGRMS) shall be adhered to in all silviculture planning and operations. The standards specify rules for seed and vegetative material collection, registration, storage, handling, and testing for improved stock.

8.2 Reforestation Program

8.2.1 The reforestation program, which is part of the AOP, shall be submitted:

a) as specified in an FMA or at a time agreed to by Alberta.

Harvest areas (openings) shall be clearly identified (e.g., maps, spatial files, or delineation on the ground through visual markings).

8.2.3 The reforestation program shall include the following components and information:

a) silviculture prescription;
b) silviculture treatment schedule;
c) maps as requested by Alberta;
d) proposed blocks for declaration in lieu of survey and re-treatment.

a. Silviculture Prescription

The prescription is a specific tactic or range of tactics for specific strata. A tactic is considered to be a treatment that supports the stand prescription. The strata prescription is a combination of tactics (treatments) to meet the stand growth objectives in the FMP. A prescription table or ‘matrix’ shall be developed for each stratum upon which FMP yield curves are based. Though the prescription matrix is a component of the FMP, it must be restated in the reforestation program in order to reflect changes in tactics assumed in the FMP strategy but altered to better account for site-level differences. Any element of the proposed reforestation program, particularly tactics, which are different from those proposed in the FMP, must be justified. The following information is required in the silviculture prescription matrix:

I. Reforestation strata – Same as growth and yield strata from the FMP, but prescriptions shall be specific to species, management intensity, silviculture system, and ecosite (where warranted).
II. Species – primary species to reforest
   • Silviculture System – Even-aged: clearcut, patch cut, partial cut, CT, seed tree, shelterwood, sanitation cut, coppice, understory protection, or uneven-aged: group selection, and single tree selection (as defined in the Alberta regeneration information system (ARIS) Industry Operations Manual).
III. Timing of Treatment - by year post harvest
   • Site Preparation – type of mechanical or chemical treatment (chemical, target, method)
IV. Planting – density, fill in vs. full plant
V. Seeding – artificial or leave for natural
VI. Leave For Natural – suckering or seed (no site prep other than harvesting)
VII. Stand Tending – target species for removal and crop tree density
VIII. Fertilization – method, rate, and type
IX. Herbicide application
   • Thinning – timing, target density, and type of thin (CT or PCT)
Proposals for herbicide application shall be submitted for approval in accordance with Alberta requirements (see Herbicide Reference Manual). Herbicide proposals are a component of the reforestation program in the AOP, but may be submitted separately from the AOP.

CT proposals shall be submitted for approval as part of the AOP unless otherwise agreed by Alberta, in accordance with Alberta’s requirements.

Example Silviculture Prescription Matrix:

<table>
<thead>
<tr>
<th>Yield &amp; Reforestation Strata</th>
<th>Transition Assumptions and Regen Lag</th>
<th>Species &amp; Planting Density (if applicable)</th>
<th>Understory Protection</th>
<th>Activity</th>
<th>Timing (year after harvest)</th>
<th>Comments/ Rationale for Variance</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - C – P1 – all ecosites</td>
<td>100% to C-P1 2 year regen</td>
<td>P1 - LFN</td>
<td>No</td>
<td>Clearcut Drag scarify</td>
<td>0</td>
<td>As per FMP strategy</td>
</tr>
</tbody>
</table>

b. Silviculture Treatment Schedule

The silviculture treatment schedule shall contain the following information:

- a list of harvest areas and the area (ha) to be treated;
- the reforestation strata standard for each harvest area (see below for more detail);
- a silviculture access plan which includes location of access, method of access and location and type of crossing structures;
- season or date of activity – summer vs. winter.
The following proposed reforestation activities for each harvest area (or stand) shall be listed:

I. Site Preparation – type of mechanical or chemical treatment
II. Planting – species, density, and proposed lot number
III. Seeding – species and proposed lot number
IV. Leave for Natural – species (deciduous vs. pine)
V. Tending – target species
VI. Fertilization – type
VII. Herbicide/Pesticide application – type, and method (ground vs. aerial)
VIII. Thinning
IX. Regeneration surveys – establishment and performance
X. Cone/cuttings collection – (if unknown, Alberta shall be notified regarding collections as per the ‘Alberta Forest Genetics Resource Management and Conservation Standards’)

If a harvest area is declared sensitive, the forest operator shall provide additional information beyond the strategic and tactical levels (see section 3.4.10). This information shall include the actual techniques (e.g., type of site preparation machine) and their expected impact on the harvest area attribute(s) that make it a sensitive site (e.g., providing frequent furrow trenching breaks on down hill run to reduce erosion).

Note that proposals to deploy seed or vegetative material outside the seed zone or breeding region require prior approval of the Provincial Seed Officer at the Alberta Tree Improvement and Seed Centre.

c. **Map**

As part of the reforestation program, a map may be requested (At Alberta’s discretion, the FHP may be used) that identifies:

I. all harvest areas to be treated; and all roads and stream crossings to be constructed or used (designating their season of use);
II. all harvest areas from integrated operations.

d. A listing of harvest areas where a declaration is proposed in lieu of a survey for areas not likely to meet regeneration standards (per TMR 141.9) and harvest areas where re-treatment is proposed (per TMR 142.1.

I. blocks where ‘let it grow’ is the retreatment strategy will require survey information supporting re-treatment rationale.
II. may be submitted for review and approval at any time throughout the year for approval to ensure timeliness of treatments.

See Section 12.0 REPORTING for reforestation activity reporting requirements.
8.3 SILVICULTURE OPERATIONS

8.3.1 Site preparation and other silviculture activities must follow the same AOP conditions and ground rule standards which apply to timber operations (i.e., stream crossing requirements, watercourse buffers, tree/understory retention, and Forest Soils Conservation Guidelines).

8.3.2 Herbicide, pesticide and fungicide use shall be performed in accordance with Alberta requirements.

8.3.3 Site preparation equipment shall be cleaned and free of restricted and noxious weed seed or plant parts before entry into the working area or before mobilizing between projects according to Alberta requirements.

8.3.4 Planting boxes shall be disposed of within 24 months of logging (skid clearance) and are to be removed to an appropriate disposal facility if ground access exists or the block does not contain any debris piles. If ground access does not exist, boxes may be securely placed within existing debris piles for disposal by burning. All plastic shall be removed from boxes and disposed of at an approved waste disposal site prior to burning. Based on past company performance to this issue, Alberta may condition the AOP to remove all boxes.

9.0 SOILS

PURPOSE

To conduct timber harvest, road construction, reforestation and reclamation operations in a way that shall:
- minimize the potential for soil erosion;
- prevent soil, logging debris and deleterious substances from entering watercourses;
- ensure that the capability of the site to support healthy forest tree growth is maintained.

DISCUSSION

Minimizing soil displacement, compaction and rutting/puddling during road construction, harvesting, and silvicultural operations is a primary concern. Soils are most at risk of compaction and rutting/puddling when the soil is moist or wet, with the more poorly drained soils remaining wetter longer. The soils are equally at risk in the winter months if they are wet and the soil has not frozen, which is a common occurrence. Rehabilitation of compacted soil in harvest areas (off–road) is seldom an option because they are generally wet and additional machine traffic will often cause more soil damage. Therefore, protection of soil is best achieved in choice of equipment, staff training and advanced planning of operations. In terms of advanced planning, it is recommended that a pre-harvest site assessment include the evaluation of soil drainage class across the harvest area delineating sensitive areas with imperfectly and poorly drained soils. Management of field operations shall involve operating on soils when they are as dry as possible.

GROUND RULES

Pre-harvest planning

9.1 Areas susceptible to rutting, puddling or compaction shall be avoided when planning temporary roads, decks, landings and skidding patterns.
9.2 Areas susceptible to rutting, puddling or compaction shall be scheduled for harvest during dry or frozen conditions (e.g., harvest areas with predominantly imperfectly-poorly drained soils).

9.3 The total area covered by temporary roads, bared processing areas, and soil displaced during timber harvesting operations shall not exceed five (5) percent (%) of each harvest area without Alberta’s approval. Blocks less than 7 ha or narrow blocks may exceed 5% with these blocks reported on the as-built.

Harvesting

9.4 Operations shall not occur when soil conditions are near or at field capacity (saturated).

9.5 The weather and percentage of sensitive areas in the harvest area shall be taken into account when scheduling areas for harvesting. Following a long dry period in summer, the sensitive sites shall be scheduled accordingly.

9.6 Minimize the machine traffic on sensitive areas depending on soil susceptibility to disturbance according to the results of a hand test (see figure 1).

9.7 Operations shall cease within the sensitive site when instances of multiple ruts in a limited area are created that are clearly related to operations during unfavourable ground conditions.

9.8 Erosion and soil disturbance must be limited, with effort made to retain organic matter and soil nutrients.

Post-harvest reclamation/reforestation

9.9 Site preparation creating linear disturbance patterns, shall be oriented to minimize channeling of water downslope.

9.10 Roads within harvest areas that are no longer required shall be reclaimed and reforested. Treatments acceptable to Alberta are required on compacted soils.

Operations in permafrost areas

9.11 Areas with a known presence of permafrost shall have a Detailed Harvest Area Plan (DHAP) submitted as per section 3.4.9. This plan shall include:

a) how permafrost is to be identified prior to the commencement of operations and what methods will be used (i.e., visual assessments, probing, photo interpretation, drilling and sampling of cores);

b) methods that will be utilized to eliminate/minimize damage to permafrost;

c) operator awareness plans/programs.

9.12 Areas where permafrost is encountered during operations shall be reported to Alberta and operations shall adhere to methods described in 9.11 b) and c) or as approved by Alberta.

10.0 FOREST HEALTH/ PROTECTION

10.1 INSECT AND DISEASE

PURPOSE

To minimize the risk of occurrence, and spread of insects and disease, which have the potential to impact forest management objectives.
To prioritize the salvage of timber damaged by insects and disease.

DISCUSSION

The impact of certain insects and diseases shall be addressed when planning harvesting, silviculture operations, and surveys. Several biotic and abiotic forest health agents affect the growth and survival of trees. Each agent poses a threat to the forest. Priority for management shall be given to those agents that have the greatest impact or could potentially cause the most damage by:

a) increasing the wildfire hazard;
b) reduction or loss of merchantable volume;
c) detracting from landscape aesthetics.

GROUND RULES

10.1.1 Harvest plans and operations shall be prioritized in stands with insect and disease issues. Variance from the SHS to address insect or disease issues may be acceptable if approved by Alberta. Infected and infested stands shall be ranked based on the type and intensity of insect and disease present, or the presence of dead trees.
Stands or trees shall be ranked for treatment or harvest as follows:

Rank 1: Stands or trees with the presence of mountain pine beetles or spruce beetles.
Rank 2: Stands with a significant number of dead or dying trees resulting from fire, insects or disease, and windthrow.
Rank 3: Stands infected with mistletoe, spruce budworm, forest tent caterpillar, root disease (Tomentosis, Armillaria) or jack pine budworm.
Rank 4: Stands infected with needle cast, Western gall rust, root collar weevils, Atropellis or other miscellaneous forest health agents.

10.1.2 Management tactics are based on the Forest Protection ranking as follows:

Rank 1 stands or trees: Control measures must be undertaken before adult beetles take flight, either through harvest or single tree treatment. Alberta and forest operators shall work co-operatively to prevent spread through aggressive action.

Rank 2 stands: Shall be addressed through salvage planning process (see section 3.6, Salvage Planning). Highly unpredictable spread therefore, salvage planning is initiated.

Rank 3 stands: To manage dwarf mistletoe operators shall:
- create a 30 m wide mistletoe-free zone adjacent to the harvest area;
- create a 30 m wide non-host buffer beside the harvest area perimeter; or
- reforest the harvest area to a non-host species.

Any wildlife tree patches shall consist of non-pine species where possible. For other pests, contact Alberta.
**Rank 4 stands:** Generally, no control is required for mature stands. Regenerated stands affected by Western gall rust or root collar weevils may require site treatments. Contact Alberta.

10.1.3 Insect and disease assessment information shall be utilized in the CA. Where a CA is not required, the assessment information will be used to develop the GDP. Where new infestations are found, or for known infestations already sequenced through the SHS, they shall be addressed in the FHP.

10.1.4 Any infestation of Rank 1 agents and all data must be reported to Alberta immediately.

10.1.5 Where dues relief is requested, mistletoe infected stands must be surveyed using an acceptable rating system (e.g., Hawksworth system).

### 10.2 WEED MANAGEMENT

**PURPOSE**

To minimize the impact of non-native, restricted, and noxious weeds, in the Green Area.

**DISCUSSION**

The invasion of restricted and noxious weeds in the forested area of Alberta negatively affects the integrity of the ecosystem. The invasive weeds alter natural processes and displace organisms that naturally occur in the area.

Under Alberta statutes, the occupant (or owner if there is no occupant) must destroy all restricted weeds, control all noxious weeds and prevent the spread or scattering of nuisance seeds.

**GROUND RULES**

10.2.1 Forest operators shall follow Alberta’s requirements (Directive 2001-06) for weed management in forestry operations (see appendix 3).
11.0 ROADS

11.1 ROAD CLASSIFICATION

PURPOSE

To define a road classification system that provides guidelines to all forest operators and potentially all resource users in the ground rule zones.

DISCUSSION

As roads are one of the most significant components of forest harvesting operations, forest operators along with Alberta shall co-ordinate and integrate road planning and construction plans with other resource operators. This classification system will provide consistent working guidelines to be used in planning and operations to facilitate integration. It is important to identify not only construction schedules but closure and reclamation timelines as well. Long term planning of access roads is a significant tactic to address landscape access issues.

GROUND RULES

11.1.1 The operator shall utilize the classification system described in Table 3 during planning and operations.

11.1.2 All roads, regardless of class, with a lifespan of greater than three years shall be built under the authority of a DLO.

11.2 ROAD PLANNING AND DESIGN

PURPOSE

To outline the plan to construct, maintain and abandon roads.

DISCUSSION

The impacts of roads shall be recognized as long-term, since most roads may never be reclaimed. It is therefore important that the initial placement of roads be carefully examined. Resource values shall be assessed during the process in order to best mitigate impacts or enhance benefits associated with those values.

Road corridor plans shall be developed in the FMP. All road construction, maintenance and reclamation shall follow the FMP.

The submission of road plans will assist Alberta to facilitate the integration of access management among all resource users (e.g., oil and gas industry). Road plans shall forecast corridor development linking all compartments and other industrial developments.

Safety needs to be addressed throughout the road planning process.

GROUND RULES

11.2.1 Long-Term Roads (Class I, II, III)

Road Planning

11.2.1.1 Forest operators shall annually submit a road construction schedule in the GDP. Proposed deviations from the FMP long-term corridor plan require Alberta’s approval. The minimum scope of the road construction schedule shall be a five-year forecast with the content requirements being:

Map showing:

a) existing forest operator roads by class;
b) other existing roads if the digital information is available;
c) proposed forest operator corridors, including corridors approved in the FHP;
d) access control points (see section 11.5 Access Control).

61
11.2.2 Phased Planning Process

Phase 1: Corridor Planning

11.2.2.1 The corridor planning process may commence at any time during the year provided that the corridor has been identified in the road plan and dialogue with Alberta has been initiated.

11.2.2.2 The Phase 1 corridor plan for new road proposals requires the forest operator to work with Alberta to:
   a) identify the corridor and potential alternatives;
   b) identify other overlapping industrial users and work towards an integrated access/corridor strategy;
   c) rationalize the corridor based on timber considerations (i.e., summer vs. winter access);
   d) highlight potential impacts on other forest resources, such as:
      - watercourses,
      - fish and wildlife habitat,
      - grazing dispositions,
      - soils,
      - trappers,
      - protected areas,
      - recreation areas;
   e) identify measures designed to mitigate impacts (e.g., timing constraints during construction and access control requirements).

11.2.2.3 The corridor plan shall be submitted three years prior to road construction.

11.2.2.4 Forest operators with overlapping tenures and other industrial users shall consult each other to ensure consistency in their corridor planning.

11.2.2.5 Forest operators shall advise other industrial operators of their road plans and strive to integrate road access with those operators.

11.2.2.6 Corridor plans shall follow the direction in strategic land use plans and policies.

11.2.2.7 The review and approval process is as follows:
   a) two months for review by Alberta – comments back to the forest operator;
   b) forest operators shall address any concerns prior to resubmission;
   c) Alberta shall approve within one month of final submission, provided no deficiencies exist;
   d) Alberta may identify in the approval additional requirements to be submitted with Phase 2, based on site sensitivity.

11.2.2.8 Exceptions to this process may arise (e.g., a salvage scenario). A written proposed action plan to vary from the indicated timelines must be submitted by the forest operator documenting the reasons for the modified review and approval process. Both the forest operator and Alberta recognize that time may be of the essence.

Phase 2: Detailed Planning
11.2.2.9 In order to reduce submissions and avoid duplication, Phase 2 shall consist of the DLO application process on the Phase 1 road.

Phase 3: Construction

11.2.2.10 Road construction shall be carried out as per Table 3 as well as conditions specified in the letter of authority for the DLO.

11.2.2.11 The road centre-line, as-built, shall be submitted, in a format acceptable to Alberta by the forest operator within 90 days of construction.

11.2.3 Temporary Roads: Class III and Inter-harvest area Class IV (with lifespans up to three years from start of construction).

11.2.3.1 These roads shall be built as per the approved AOP. Only roads with FHP approvals shall be included in the AOP submission. As-built road plans shall be submitted at Alberta’s request by the forest operator in a digital format, within 90 days of construction.

11.3 ROAD CONSTRUCTION, MAINTENANCE AND RECLAMATION

Purposes

The roads shall be constructed, maintained and reclaimed in a timely manner to minimize environmental impacts.

Ground Rules

11.3.1 General

11.3.1.1 Existing access (e.g., seismic lines, trails, existing roads) shall be used as a priority wherever practical and feasible.

11.3.1.2 Road ROWs shall be cleared according to standards established in Table 3, road comments, and any additional conditions approved in the FHP.

11.3.1.3 Roads and landings shall be constructed to avoid:

a) unstable soils, water source areas, springs and seepage areas;

b) creating disturbed, compacted or bared soils that exceed the amount specified in section 9.3 – Soils.

11.3.1.4 Temporary road construction activities that are required outside an approved ROW can be considered incidental to construction and will be approved as part of the AOP provided the following is met:

a) Be immediately adjacent to AOP approved disposition (temporary road and associated ROW only);

b) Be reclaimed or reforested in the same fashion as the adjacent AOP approved disposition (if applicable);

c) Be without conflict of existing dispositions and/or adjacent land uses; and

d) Be an activity type and within the parameters as described below:
• Log Decks or Decking Areas:
  i. ≤ 0.18 hectares in size;
  ii. Located on average ≥ 400 metres apart.

• Bank Stabilization:
  i. Related to hill cuts impacted during construction.

• Push Outs:
  i. ≤ 0.04 hectares in size;
  ii. Located on average ≥ 800 metres apart. Where this distance is not feasible due to operational constraints, line of sight between push outs should be minimized.

• Helipads
  i. < 0.1 hectares in size;
  ii. Located on average > 800 metres apart;
  iii. Focus on lesser vegetation and existing openings.

11.3.2 Construction

11.3.2.1 Roads, skid trails and landings shall be placed in locations and constructed so that soil erosion, damage to streambeds and sedimentation of watercourses are minimized.

11.3.2.2 On those parts of the ROW not used for grade construction, disturbance to the duff and organic soil shall be minimized to reduce damage to the roots of bordering trees and to provide a protective soil cover.

11.3.2.3 Trees with root systems seriously damaged by road construction activities shall be removed from the edge of a road cut and reported on the next weekly report.

11.3.2.4 The fill required for road construction shall be taken from the ROW when feasible.

11.3.2.5 All borrow pits required off the ROW must be authorized by an appropriate land use disposition before they are developed.

11.3.2.6 All sand and gravel pits off the ROW must be authorized under an appropriate disposition.

11.3.2.7 Removal of sand and gravel from within the channel or floodplain of any watercourse is prohibited.

11.3.2.8 Active long-term roads shall be properly maintained to reduce wheel or track ruts, and to minimize watercourse sedimentation from erosion and traffic during adverse weather.

11.3.3 Erosion Control/Prevention

11.3.3.1 Erosion control shall be implemented as per Table 3.

11.3.3.2 Initial erosion control measures shall be concurrent with grade construction. Preferably, no more than a two km length of bared surface shall be developed between the time the sub-grade is constructed and the completion of erosion control activities.
11.3.3.3 Constructed roads require erosion control and stabilization of disturbed soils.

11.3.3.4 Ditches shall be constructed to the same gradient as the road and shall be deep enough to drain the sub-grade, unless limited by topography. Ditch backslopes shall have a regular profile from the top of the cut to the bottom with no hanging banks or vertical cuts.

11.3.3.5 Water from roads ditches and bared soil surfaces shall not be permitted to drain directly into watercourses. Where buffers alone do not retard water and soil movement effectively, vegetated buffers shall be left or a system of obstructions (e.g., logs, rocks, mounds) installed to dissipate the force of water.

11.3.3.6 Cross-drainage culverts and other drainage devices shall be installed as road sub-grade construction progresses. Cross-drainage structures shall:
   a) reduce water movement along ditches;
   b) divert water from the ROW into the surrounding vegetation directly as possible;
   c) provide cross movement for water from seeps and springs;
   d) be installed with adequate spillways or downspouts where they drain onto unstable or bare soil.

11.3.3.7 Re-vegetation shall be completed concurrent with operations or as soon as soil conditions permit during the following growing period. Existing ditch vegetation shall be protected during road maintenance wherever possible and re-established with approved vegetation species where necessary.

11.3.3.8 A portion of the debris from clearing, and strippings from road and landing construction shall be retained and used for re-vegetation and erosion control on disturbed areas.

11.3.4 Reclamation

11.3.4.1 Roads not under DLO that are no longer required shall be reclaimed, have crossings removed, and their condition monitored until they are considered satisfactorily stabilized.

11.3.4.2 Certified weed free seed shall be used when seeding is used for reclamation.

11.3.4.3 Roads under DLO that are no longer required shall be reclaimed, and require a Letter of Clearance.

11.3.4.4 All borrow and gravel pits no longer required must be reclaimed (re-contoured to stable slopes and re-vegetated) unless approval has been given to allow water to fill the pit for wildlife or wildfire purposes.

Seasonal Reclamation

11.3.4.5 Certain roads that are not used continuously throughout the year may require intermediate erosion control measures such as:
   a) shallow surface cross ditches based on slope and soil type;
   b) re-established drainage;
   c) slope stabilization;
   d) rut-free driving surface establishment;
   e) access control measures.
Partial Reclamation

11.3.4.6 Roads that are not immediately required but necessary for future operations shall be reclaimed to the following standards unless otherwise approved in the AOP.
   a) Watercourse crossing and drainage structures that have a high risk of erosion or failure are removed, and stream banks and approaches reclaimed.
   b) All potentially erodible slopes are stabilized through rollback, seeded to approved vegetation species, and cross-ditched to disperse runoff and suspended sediment into undisturbed areas.
   c) Access closure structures are installed where required.

Total Reclamation

11.3.4.7 Roads and associated bared areas that are no longer required, shall be permanently reclaimed by completing all of the following:
   a) decompacting, scarifying and returning them to an acceptable landform;
   b) removing all watercourse crossing and drainage structures and reclaiming stream banks and approaches;
   c) cross-ditching, rolling back topsoil (including slash and logging debris) and re-vegetating erodible bared surface areas;
   d) reforesting disturbed areas inside harvest areas and where mutually agreed to, outside of the harvest area;
   e) establishing access closures where required.
   f) where agreed to by Alberta, the company may leave all terrain vehicle (ATV) access for silviculture purposes. Rollback shall be done on approaches to all watercourses.

11.4 WATERCOURSE CROSSINGS

PURPOSE

To provide guidance so that crossings are constructed, maintained and reclaimed in a manner that mitigates environmental impacts.

DISCUSSION

It is important to implement watercourse crossings of acceptable standards to meet the needs of all users. Of primary importance is protection of the aquatic environment. It is intended that water quality, fish passage, bank stability and aquatic fauna habitat are not compromised during watercourse crossing construction, maintenance and reclamation.

The planning of watercourse crossings must consider tenure, user integration, timing constraints, existing plans and assessments, and pertinent policy and legislation. Watercourse crossings shall be designed, installed, maintained and deactivated in accordance with all applicable policy and legislation. See Section 7.6 for additional information on the watercourse crossings.
11.4.1 The company shall require approval for any crossing not listed in Table 4 for the appropriate watercourse type.

</table>

- Flow is not impeded.
- Notification of crossing type to Alberta is required on the first block status report after installation.
- Low profile crossings are used where bank protection is achieved through simple freezing in during frozen conditions.
- Any change within a category only requires notification to Alberta.

11.4.2 Intermittent and higher-order streams shall be classified either during the EFR or in the FHP.

11.4.3 Proposed watercourse crossing structures and locations shall be identified in the EFR or applicable FHP.

11.4.4 Unless otherwise approved, watercourse crossings shall:
   a) minimize erosion and sedimentation;
   b) have stable approaches;
   c) be at right angles to the watercourse;
   d) be at locations where the channels are well defined, unobstructed and straight;
   e) be at a narrow point along the watercourse;
   f) allow room for direct gentle approaches;
   g) have no direct ditch drainage.

11.4.5 Watercourse crossings shall accommodate peak stream flows at the following levels:
   a) long-term roads (Class I – III) – shall be designed for a minimum of 1:50 year flood levels; and
   b) temporary roads (Class IV) – shall be designed for a minimum of 1:25 year flood levels with the exception of temporary winter crossings that are removed before break-up.

11.4.6 On approaches to watercourse crossings, the organic soil layer and lesser vegetation shall not be stripped from portions of the ROW not needed for the road grade.
11.4.7 Any in-stream activities shall be scheduled to avoid migration, spawning and incubation periods of migratory or resident fish species (restricted activity periods). Mitigation measures approved by Alberta may allow for deviations from the in-stream timing constraints.

11.4.8 Fish passage for migratory or resident species must be maintained at all watercourse crossings on fish-bearing waterbodies.

11.4.9 The flow of the watercourse must be maintained at all times when carrying out in-stream activities, unless otherwise approved under the Water Act.

11.4.10 Measures must be implemented to minimize the duration and amount of disturbance of the bed and banks of the watercourse or waterbody. Where damage to the bed and banks of a watercourse occur, appropriate measures to restore the bed and banks must be undertaken.

11.4.11 Measures must be implemented to prevent the deposition of soil, logging debris or other deleterious substances and materials that are toxic to, or an immediate threat to fish and other aquatic organisms into any watercourse. Any such substances or materials unavoidably deposited in a watercourse must be removed immediately and reported to Alberta.

11.4.12 Measures must be implemented to prevent the transfer of biota that are not indigenous to the environment at the watercourse-crossing site.

11.4.13 Stream crossings shall be kept free of accumulated debris. Culverts plugged with ice shall be reopened to prevent flooding during spring thaw.

11.4.14 Interim erosion control measures (e.g., silt fences, straw bales or matting, gravel check dams) must be implemented and maintained until permanent vegetation and erosion control measures are established where necessary.

11.4.15 Stream crossings that fail shall be reclaimed or replaced (if necessary) with more appropriate crossing structures as soon as possible or within one year unless otherwise approved by Alberta.

11.4.16 Bridge abutments shall not constrict the normal stream channel. Where stream banks must be built up to construct a bridge abutment, soil shall be brought in and deposited from the end of the grade – no equipment shall enter the stream channel. Bridge spans must extend beyond stream banks and abutment walls.

11.4.17 The use of bridges is preferred on fish-bearing streams however, steel culverts may be permitted where they will not restrict passage of fish. Bridges over one span or culverts larger than 1.5 m in diameter require a permit from the Water Management Branch.

11.4.18 Culverts for all classes of streams must be designed and installed to prevent erosion at both the inflow and outflow ends of the structure. Culverts shall be of sufficient length beyond the fill with the overburden properly backsloped and stabilized to prevent sediment from entering the watercourse, and the ends of the culvert open at all times. Any culvert that becomes a hanging culvert must be correctly re-installed as soon as possible or within one year unless otherwise approved by Alberta.

11.4.19 Properly constructed logfills (see 11.4.21 below) on temporary roads may be used to cross ephemeral watercourses during dry periods, and to cross intermittent watercourses (with developed channels) during frozen periods. As soon as the temporary road is abandoned, logfills shall be removed so that no soil is allowed into the water channel. Logfills installed during frozen periods shall be removed before
the spring thaw. A bottom layer of logs may be left in place when removing the logfill to provide for summer crossing of ephemeral watercourses.

11.4.20 Crossing intermittent or ephemeral watercourses within harvest areas shall be avoided when possible. When the crossings are necessary, they shall be constructed at specified locations using appropriate watercourse crossing structures.

11.4.21 A properly constructed logfill has all of the following:
   a) enough logs to adequately fill an ephemeral draw or watercourse channel so that when the logs are removed there is little or no damage to the banks or channel bottom;
   b) logs delimbed and bucked to at least 1.5 m longer than the grade fill at each end;
   c) logs covered by a layer of suitable material (e.g., burlap or geotextile cloth) that separates the soil from the logs, which shall permit total removal of the soil cap;
   d) cables laid under logs to allow for easy removal, or other provisions for removal that do not disturb the banks or watercourse.

11.4.22 In fish-bearing watercourses, any negative impacts on the stability and fish habitat values of stream banks must be minimized. Any damage to streambanks and the corrective measures taken by the company shall be reported to Alberta within 7 days of the occurrence.

11.4.23 A native timber bridge may be used provided that all of these requirements are met:
   a) bridge abutments do not restrict stream channel;
   b) a brow log is installed on both sides of the bridge deck to prevent soil from entering the stream;
   c) no equipment enters the stream channel;
   d) timber of suitable size and strength is available for construction;
   e) the span extends beyond stream bank and abutment walls;
   f) a separation layer is used between soil cap and timber;
   g) The soil cap and separation layer is removed as soon as harvest, hauling and silviculture are complete;
   h) the remainder of the structure is removed as soon as harvest and hauling operations are completed unless a proposal to leave crossing structures in place after hauling is approved by Alberta and an acceptable monitoring program is in place.

11.4.24 Snow-fills and low profile crossings may be used on watercourses as per Table 4 during frozen conditions provided that all of the following requirements are met:
   a) sufficient snow exists to fill creek channel;
   b) flow is maintained;
   c) any soil cap installed over the snow is removed prior to break-up;
   d) measures are in place to prevent soil or other debris from entering stream channel or ice surface;
   e) suitable measures are taken during deactivation to ensure flow is not impeded.

11.4.25 Ice bridges may be used during frozen conditions provided that all of the following requirements are met:
   a) no capping material is used on the bridge;
   b) winter stream flows are not impeded;
   c) approaches of snow and ice constructed of sufficient thickness to protect the stream bank;
   d) appropriate ice thickness exists to bear necessary load requirements;
   e) no alterations to streambed or bank are required;
11.4.26 Each operator shall establish a monitoring program for their watercourse crossings. Documentation as to current condition, repair requirements, or removal dates of the crossing structures must be maintained and made available to Alberta upon request.

11.4.27 Watercourse crossings that are no longer required shall be reclaimed and their condition monitored until they are satisfactorily stabilized.
   a) removing all watercourse crossing and drainage structures and reclaiming stream banks and approaches;
   b) cross-ditching approaches, rolling back topsoil (including slash and logging debris) and within one year re-vegetating erodible bared surface areas with vegetation capable of maintaining bank stability (e.g., this may include the use of sedges and willow cuttings).

11.5 ACCESS CONTROL

PURPOSE

To manage existing and proposed surface access recognizing key resource values.

DISCUSSION

Resource values may require mitigation from the impacts of roads through access control measures. Wildlife, sensitive areas (i.e., historical sites, soils), protection of road quality and safety are reasons for implementing access control. A number of strategies and tactics are available for controlling or restricting access.

Access control measures for long-term roads shall be identified through the submission and review of the phased planning process. For temporary roads, the CA or GDP, and FHP shall be the mechanisms used in identifying access control requirements.

The following list of access control methods identifies a number of options that may be implemented:
   • physical barriers (e.g., gates; barricades, pilings);
   • road condition (e.g., berms, ditches, road standard, roll-back, no snow removal);
   • regulatory (e.g., sanctuaries, timing restrictions, signage).

GROUND RULES

11.5.1 Where access control has been identified as an objective in strategic land use plans, Alberta shall consult with the forest operator to determine an access control strategy. In the event that a strategic land use plan has not been developed, the FHP shall describe specific access control measures identified in the GDP or FMP (see section 3.4).

11.5.2 In designated areas, Alberta may direct forest operators to restrict road access during specified periods, implemented in accordance with Alberta policy. Restricted access issues shall be dealt with differently depending on whether the road is new access or is existing access. All closures of existing access must be submitted to the Minister or his authorized delegate for approval whereas new access shall have the terms defined in the approval of the disposition.
11.6 CAMPS AND FACILITIES

PURPOSE

To give guidance to forest operators so that the planning, construction, maintenance and reclamation of camps and miscellaneous facilities is done in a manner that minimizes negative impacts on the forest environment.

DISCUSSION

Camps and other facilities are often a necessary part of operations in remote areas. Forest operators require that such facilities operate in an efficient and cost-effective manner and are implemented without compromising the integrity of the environment.

Some of the best practices for camps and facilities include:

- place sites out of visual and auditory range from mineral licks and key wildlife areas or use a default of one kilometre;
- safe camp locations are a priority therefore, an evaluation of all potential risks shall be conducted prior to selecting a final camp location;
- camps and fuel storage sites shall be identified in the annual fire control plan when proposed locations are known;
- camps shall be kept clean. Proper mechanisms for the disposal of hazardous and non-hazardous waste shall be implemented.
- temporary fuel storage sites shall not be located within 100 m of any flowing watercourse;
- camp food and garbage storage shall minimize the potential for problems with wildlife. Recommend following the Bear Smart guidelines for specific mitigation relating to bears. Problems with wildlife shall be dealt with in consultation with Alberta.

GROUND RULES

11.6.1 Any facility or camp that shall be in place for more than 12 consecutive months requires an appropriate disposition under the Public Lands Act. Temporary field authorities (TFAs) are required for camps to be in place less than twelve consecutive months.

11.6.2 Any facility or camp must adhere to all provincial regulations related to the camp (i.e., Public Health Act – Work Camp Regulation.).

11.6.3 Where feasible, forest operators shall establish temporary camps and/or other facilities within either new harvest areas or existing clearings (i.e., gravel and borrow pits).
12.0 REPORTING

PURPOSE

To ensure that forest operation activities are reported to Alberta in order to maintain an accurate and current database across the province.

DISCUSSION

Silviculture and harvest operations reporting and monitoring is necessary to ensure legislated requirements are met in all treatment areas. Ground rules governing operations reporting are required to ensure consistency among forest operators. The intent of activity reporting is to communicate that a given activity has occurred, where it occurred and when it occurred. This information shall also be used for annual and stewardship reports and shall be RFP validated as per Appendix 1.

GROUND RULES

SILVICULTURE AND HARVEST ACTIVITY REPORTING

12.0.1 Forest operators who conduct silviculture work on their disposition shall report the details of all work completed in the previous year annually into ARIS no later than May 15. The required information is outlined in the ARIS Industry Operations Manual. Information shall be submitted in accordance with all requirements of the manual and associated policy directives.

12.0.2 Alberta may require additional reporting for forest management activities such as thinning, herbicide, pesticide spraying, or fertilization. Alberta shall consult with the company on the appropriate format of such reports. Reporting of herbicide projects are as per Alberta requirements.

12.0.3 Companies harvesting more than 30,000 m³/yr shall have self-inspection agreements in place and shall carry out periodic inspections of active timber operations and report the information to Alberta in a format acceptable to Alberta. Reports based on the 2006-04 directive shall be submitted to Alberta at agreed to intervals, or at a minimum once per month. As built harvest area maps shall be submitted as per 3.3.5.

12.0.4 Forest operators who constructed roads shall report to Alberta annually in the road plan of the GDP per the requirements of 11.2.1.1 in the Roads section in this annex.
Appendix 1 - Role of Registered Forest Practitioner in Forest Management

Annex 2
Role of Regulated Forestry Professionals (RFP) in Forest Management

The Alberta Government is committed to sustainable management of forests on public land to provide benefits and opportunities for Albertans. Alberta relies on the professional integrity of RFPs to enhance the effectiveness of forest resource management planning, implementation and harvest activity, while recognizing the interdisciplinary nature of forest management planning.

Alberta requires a RFP to submit the components of forest management plans, annual operating plans and harvest activity reporting, as identified in this annex, for approval.

1.0 Validation by a RFP
RFPs shall validate their submitted work by one of the following methods:

i. Signing a plan using their professional title and registration number.

ii. Stamping and signing plans using the seal provided by a College.

iii. Using other mechanisms approved by Alberta.

1.1 Significance of RFP Validation
RFP validation provides assurance to Alberta that work is accurate and has been prepared with due diligence. Government RFPs shall review validated work by conducting a reasonable assessment for accuracy and shall take appropriate corrective actions where validated work is not accurate.

The documentation required to demonstrate due diligence is viewed as a significant source for validating accuracy. Alberta will not accept inadequate documentation and may refer such occurrences to the Complaints Director of the appropriate College.

1.2 Approval of Validated Work
Alberta’s approval does not transfer the accountability for the plan or its implementation from the Organization or the submitting RFP to Alberta or its staff. Approval of validated work shall be addressed as described below.

1.2.1 Appraisal
Work with far-reaching and significant potential effect if inaccurate (such as but not limited to timber supply analysis, FHP). Validation of this type of work demonstrates confidence the work is accurate; however, due to its potential significance, it is both necessary and important to examine the work carefully. Approval shall be granted after the work has been reviewed by appropriate RFPs to assess accuracy. The timeline for this shall be established by Alberta and will vary depending on the nature of the validated work. Those preparing work for appraisal are advised to communicate with the reviewing government RFPs regularly and effectively to minimize confusion over the standards expected of the work.

1.2.2 Acceptance
Work with a more limited potential effect (such as, but not limited to silviculture reports, operations inspections). The work is considered approved on the date Alberta acknowledges receipt of the work. Alberta shall notify the organization by acknowledging receipt within five working days of submission. The notification date will be documented by Alberta as the start date for FHP approval. Alberta shall periodically check the work and supporting documentation to verify its accuracy.
2.0 Work Validated by a RFP
All entities that conduct timber harvesting or silvicultural activities on public land, except those harvesting less than 30,000 m³ annually from public land, must validate the items described below (the list of work to be validated may be amended from time to time by Alberta to adapt to change).

2.1 Forest Management Plans
The entire forest management plan shall be approved through an appraisal and must be validated by the senior RFP responsible for its preparation.

The following components must be validated by the RFP most directly responsible for their preparation:

i. Yield projections and all associated data and analyses – for appraisal
ii. Vegetation inventory data – for appraisal
iii. Landbase description (analysis and report) – for appraisal
iv. Silviculture strategies (refer to Annex 1, section 5.5 on managed assumptions) – for appraisal
v. Forecasting (timber supply analysis) – for appraisal
vi. Harvest planning (spatial harvest sequence) - for appraisal
vii. Monitoring reports - annual - for acceptance; stewardship – for appraisal

2.2 Annual Operating Plans
The minimum validation requirements are as follows:

i. General Development Plan – for appraisal
ii. Compartment Assessments - for appraisal
iii. Final Harvest Plan – for acceptance
iv. Road Plan and Fire Control Plan – for acceptance
v. Reclamation Program – for acceptance

2.3 Harvesting and Reforestation Activities
Accurate and timely submission of timber production and sales information is important and must be validated. The activities related to reporting timber production and sales must be approved by the senior RFP responsible for the submission.

The following components of timber production and sales must be validated by the RFP directly responsible for their preparation:

i. Scaling populations (TM262) – for appraisal
ii. Timber production audits
iii. Letters of Understanding – for appraisal
iv. Statutory Declarations of production – for appraisal
v. Harvest tenure standings – for acceptance
vi. Timber production reporting – for appraisal
vii. Silviculture information - regeneration surveys, ARIS submissions and silviculture operations reports, regeneration strata balance/swap/trade summaries – for acceptance
viii. Field operations inspection reports – for acceptance
ix. Herbicide reports – for acceptance

---

2 AOPs are approved subject to a review by Alberta. Where a compartment assessment has been completed the CA, FHP and AOP shall be appraised by Alberta.

3 Where thinning plans, herbicide plans, and reforestation prescriptions vary from FMP silviculture strategies the silviculture program shall be appraised by Alberta.
# Appendix 2 - Debris Disposal Policy

## DEBRIS MANAGEMENT STANDARDS FOR TIMBER HARVEST OPERATIONS

### 1. AUTHORITY
- Alberta Sustainable Resource Development (SRD)

### 2. PURPOSE
- To provide standards for debris management in timber harvesting operations in compliance with the *Forest and Prairie Protection Act* (FPPA) and the *Forests Act*. Compliance will reduce the threat of wildfire to communities and other values within the Forest Protection Area.

### 3. POLICY
- The FPPA defines debris management standards for debris produced from timber harvest operations. Timber and reforestation activities must comply with the FPPA and the *Forests Act*. The standards will be enforced.
- The Debris Management Standards for Timber Harvest Operations policy is effective March 1, 2010 and may be revised. In addition to the management of debris through disposal, this policy also applies to debris retained for reforestation, wildlife habitat or other landscape management objectives.

### 4. APPLICATION AND IMPLEMENTATION OF THE DEBRIS MANAGEMENT STANDARDS
- Debris management strategies must be linked to landscape objectives and must not conflict with the FPPA. The loss of productive land base resulting from timber harvest operations (debris piles, roads, landings) within the harvest area must not exceed the specifications outlined in applicable Operating Ground Rules. (As per the Timber Management Regulations of the *Forests Act*.)

#### A. Level II Mountain Pine Beetle Control Debris Management Standards
The standards specified under sections B, C, D and the FPPA apply.

#### B. FireSmart Debris Management Standards
During harvest operations, there is a need to manage debris to minimize the risk of wildfire to communities or other values at risk. In order to minimize this risk, the following standards shall be applied:

1. Within the FireSmart Community Zone (Generally a 10 kilometre buffer of the community’s development centre.), debris management strategies, for any purpose, must not include the retention of debris piles for reforestation, wildlife habitat or other landscape management objectives.

2. Outside of the FireSmart Community Zone, debris pile retention for reforestation, wildlife habitat or other landscape management objectives may be considered an acceptable debris management strategy. Retention is subject to SRD Forestry Program Manager approval through
C. Wildlife Habitat and Biodiversity Debris Management Standards
Debris piles that are retained in the harvest area outside the FireSmart Community Zone for wildlife habitat or landscape biodiversity objectives must adhere to the following guidelines:

I. If the strategy involves random scattered piles throughout the harvest area, the following standards apply:
   • Height of piles must not exceed 2 metres
   • Base diameter of piles must be no greater than 3 metres
   • Distance between piles must be no less than 25 metres
   • Distance from block edge must be no less than 25 metres

II. If the strategy involves random scattered piles made up of chip residue from chipping operations throughout the harvest area, the following apply:
   • Height of piles must not exceed 2 metres
   • Base diameter of piles must be no greater than 3 metres
   • Distance between piles must be no less than 15 metres
   • Distance from block edge must be no less than 25 metres

III. If the strategy involves piling of debris at roadside, piles must meet the following standards:
   • Piles can only be left along roads scheduled for reclamation and abandonment following the completion of reforestation (i.e. scarification, planting)
   • Piles must be compacted to a maximum of 2 metres in height, 3 metres in width, 12 metres in length and perpendicular to the road
   • A group of piles may consist of a maximum of 5 piles with a spacing of 6 metres of slash free area between each pile within the group
   • Pile groups must be separated by a 50 metre slash free spacing

D. Reforestation Debris Management Standards
Debris piles or windrows created from reforestation operations must adhere to the following specifications:

I. If the strategy results in debris piles, the following standards apply:
   • Height of piles must not exceed 2 metres
   • Base diameter of piles must be no greater than 3 metres
   • Distance between piles must be no less than 25 metres
   • Distance from block edge must be no less than 25 metres

II. If the strategy results in windrows (large logs, humus, and duff), the following standards apply:
   • Windrows must not be greater than 2 metres in height
   • Windrows must not be greater than 3 metres in width
   • Windrows must not exceed an average of 75 metres in length and must have slash free spacing of 8 metres
   • Distance from block edge must be no less than 25 metres
E. Enforcement / Approval
SRD will serve as the "one window" for industry contact and approval and will complete field inspections as required.

Debris piles to be disposed of must be in conjunction with the terms of these standards and the two year timeline set out in the FPPA. SRD will issue an "Order to Reduce or Remove a Fire Hazard" when debris piles have not been properly disposed of in accordance with this Policy and the Annual Operating Plan approved by the department.

Forest Industry may apply to SRD for a one-year extension where drought conditions have prevented them from completing disposal through burning operations. The SRD Forestry Program Manager must approve the extension.

Where debris disposal by burning is the strategy, Industry must report all burning locations to SRD one month before the start of the fire season.

F. Review Process
Research will be carried out by FP Innovations to assess the threat of wildfire associated with debris resulting from timber harvest operations. If findings indicate that standards within this policy directive are not sufficient to support wildfire hazard reduction, the standards and policy will be modified.

Appendix 3 - Directive for Weed Management.

**Directive No.** 2001-06

<table>
<thead>
<tr>
<th>Subject</th>
<th>Weed Management in Forestry Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>To implement effective weed management programs administered by holders of <em>Forests Act</em> dispositions engaged in forestry operations. This policy applies only to <em>Forests Act</em> dispositions.</td>
</tr>
</tbody>
</table>

| Policy | Section 60 of the *Public Lands Act* sets out a disposition holder’s responsibility with respect to noxious and restricted weeds on dispositions issued under that Act. Similarly, Section 31 of the *Weed Control Act* requires that the occupant (or if the land is unoccupied, the owner) of land destroy all restricted weeds, control all noxious weeds and prevent the spread or scattering of nuisance weeds. |

The weed control duties on holders of dispositions issued pursuant to the *Public Lands Act* are reasonably clear and would apply to such dispositions that are issued in relation to forestry operations (e.g. camps, roads, processing sites and other associated land uses). It is, however, not entirely certain as to how the courts would interpret and apply the definition of “occupant” under the *Weed Control Act* in respect of timber dispositions issued under the *Forests Act*.

In terms of forestry operations, the vast majority of weed management situations should fall under either the *Public Lands Act* or the *Weed Control Act*. This Directive attempts to address weed management, in a forest operations context, where neither of these two Acts apply.

The Crown’s goal is to address weed management issues on a landscape level, as opposed to on a disposition by disposition level. To accomplish this, a two step approach will be taken. Firstly, the disposition document and annual operating plans (AOP) will be used to describe the disposition holder’s obligations with respect to weed management activities. Secondly, the Land and Forest Service (LFS) (and ideally, municipalities) will establish landscape level, co-operative weed management groups, with a mandate to developing a single management plan for all stakeholders involved.

Invasive weeds can alter the ecosystem’s natural processes and displace native, threatened, and endangered vegetation and habitat. For these reasons, forest companies are expected to assist in managing weeds in the forested area of Alberta.
Procedure  
Amendment of Annual Operating Plans and Dispositions
In order to address situations that fall outside the requirements of either the *Public Lands Act* or the *Weed Control Act* all AOPs prepared and submitted for timber dispositions are to include the following condition. Additionally, this statement is to be incorporated into the disposition itself upon issuance or renewal.

“{Disposition holder} shall, with respect to the land contained in this timber disposition, prevent the establishment of and control all noxious and restricted weeds to which the *Weed Control Act* applies, in a manner acceptable to the Minister.”

The Minister will consider the “Recommended Standards of Good Practice for Prevention”, described in the Guidelines section to be the minimum level of performance for all disposition holders. Where a disposition holder or weed management group (as described below) prepares a plan outlining weed management, the commitments in that plan will become the standards to which the disposition holder or parties to the group will be expected to meet. This plan will be approved, where appropriate, by the Regional Director.

Co-operative Weed Management Groups
The LFS will establish co-operative weed management groups where willing participants are identified. The specific purpose of the groups will depend on the level of current involvement the individual participants have in weed management. Where participants are currently managing weeds, the purpose of the group may be to review individual existing weed management plans to identify opportunities for co-operative management. Where participants are not currently involved in weed management the purpose of the group may be to develop a single weed management plan for all group participants, or to assist individuals in the development of individual plans if desired.

The role and degree of involvement of LFS staff on these groups will depend on the make-up and desires of each individual group. Typically, the LFS will convene and co-ordinate weed management group meetings, in addition to other roles defined by the group. Forest Management Division staff will work with Forest Area staff to develop provincially consistent Terms of Reference for each group, and provide technical expertise and support where possible. Each group will select its own chairperson and define the roles for each member.

Weed management plans should address inventory, control, education, and prevention. Once a co-operative or individual weed management plan is agreed to, that plan will be implemented through the individual’s AOP. The results of this implementation will be used as the benchmark to which the Minister’s satisfaction for weed control and prevention is measured (i.e. vis-à-vis the AOP clause described above).

Guidelines
To assist in determining whether a disposition holder’s weed management activities are acceptable to the Minister, the following guidelines describe the four essential aspects of weed management: goals, prevention, inventory and control. All of these should be considered when developing weed management activities and plans.

A. Goals
The goals should be specific to noxious and restricted weed prevention, inventory and control. They can be short-term and long-term, as is the nature of weed management.
**B. Recommended Good Standards of Practice for Prevention**

1. **Limit Soil Disturbances**  
   To limit the establishment of weed infestations, prevent unnecessary soil disturbances wherever possible.

2. **Clean Equipment**  
   Practice due diligence by ensuring that all equipment and vehicles are free of weed seeds and plant parts before arriving on a job site. All agricultural implements or any equipment knowingly exposed to weeds are to be pressure washed prior to use in forested areas.

3. **The Use of Straw Bales for Erosion Control**  
   The use of straw bales for erosion control is discouraged in the Green Area. Unlike hay, it is very difficult to determine if the straw bales are free of weed seeds. Therefore, certified “weed free” hay bales acquired from producers with a “Certificate of Inspection” should be used for erosion control.

4. **Use Certified “Weed Free” Seed for Re-vegetation of Disturbed Sites**  
   Canada #1 Seed, approved under the Canada Seed Act, may not be weed free. To ensure a seed mix is virtually weed free, a purchaser can request a “Certificate of Seed Analysis.” To get a more detailed “Certificate of Seed Analysis,” the purchaser can request a larger seed sample analyzed, rather than the typical 25g sample to improve the confidence of the analysis. Alternatively, one can start with pure seed and then prepare the seed mix manually.

5. **Rapid Response to Weed Infestations**  
   Because a single plant and small infestations are easier to control than large infestations, it is important to manage weeds proactively. To do this effectively, industry and LFS field staff should be trained in the identification of restricted and noxious weeds, and the importance of destroying individual weed plants and reporting new infestations.

   - **C. Inventory**  
     A weed management program is most effective with an accurate account of existing weed infestations. Inventoring is most effective during the months of June through September, when most plants are in bloom and are the most easily recognized. “Noxious” and “Restricted” weed species to be surveyed are listed in the Weed Designation Regulation (138/80). Additionally, the Weed Control Act provides municipalities with the authority to designate other species of local concern as restricted or noxious. For this reason weed surveyors should obtain a list of restricted and noxious weeds from the municipal district(s) within which they are surveying.

   **D. Prioritizing Areas for Control Measures**  
   As some areas within which weeds are managed consist of a large land base, control throughout the entire area is not feasible. Specific areas should be targeted each year, based on priorities. When prioritizing areas for control treatments, many factors must be considered to deliver the most effective and efficient control program. The following example criteria are not ranked in order of importance, with exception of Restricted and Noxious:

   1. **Restricted vs. Noxious**  
      Target restricted weed infestations over noxious weed infestations. Control of restricted weeds should be implemented immediately following their discovery.
2. Location of Infestation
Target infestations in highly traveled areas over those in isolated areas, thereby limiting the threat of seeds or plant parts being transported.

3. Size of Infestation
Target small infestations before large ones, as it is easier to gain control of small infestations. This also applies to outlying pockets of larger infestations, which should be controlled prior to tackling the larger infestation. When dealing with a large infestation, a “contain and control” strategy (targeting outlying pockets, and/or the perimeter of the infestations) is an excellent option when resources are not available to control an entire infestation.

4. Weed Species
To prevent their establishment, target weed species that are less abundant on a regional basis. When controlling infestations, target the weed species with the greatest ecological impacts. In many situations this may be difficult to quantify, although generally speaking it can be done. For instance, a weed infestation encroaching on a habitat of an endangered plant species would have a higher priority than an infestation among common or non-native vegetation.

5. Co-operative Control Opportunities
Co-operative control is the most effective and efficient method to control weed infestations that span multiple dispositions or border of responsibility. Unless one is adopting a “contain and control” strategy, generally it is not a good idea to control only part of an infestation.

E. Control Options
- When selecting a control method, it is important to note that different species respond differently to each method. The most efficient programs will have an integrated control plan that includes both prevention and one or more of the following control methods:
  - **Mowing / Cutting** - Effective for perennial weeds. Careful monitoring and proper timing are necessary for this to be a viable option. If a site is mowed over several years, well-developed root systems can eventually be depleted. Weeds should not be mowed once seed set has occurred, as this will aid in spreading seed.
  - **Hand Pulling** - Effective for annual or biennial weeds, especially when dealing with small infestations or individual plants. Hand pulling may have to be done annually (before seed set) for several years, as dormant seeds in the soil may continue to germinate. If any weeds are pulled when in flower, they must be bagged and burned, as they will set seed if they are left on the ground.
  - **Herbicide Application** - Very effective but will not guarantee 100% control. Sites may have to be revisited again the next year for follow-up treatments. Several herbicides are effective for each weed species. Chemical selection should be determined by site, weed species, existing desirable vegetation, and whether or not a residual effect is wanted. Assistance with selecting a herbicide and application rate can be obtained through a Municipal District, County Agricultural Fieldman, or Certified Pesticide Applicator.
  - **Biological Control** - This method of control is the introduction of insects or diseases that attack or infect a specific weed species. Biological control agents can be difficult to obtain, and in some cases they are in the testing phase to determine effectiveness. Information regarding the biological control of weeds
can be obtained through the Alberta Research Council in Vegreville, Alberta.

**Authorities**

**Weed Control Act** - provincial legislation describing weed control and management requirements.

**Weed Designation Regulation** - lists weed species designated as restricted, noxious and nuisance in Alberta.

**Forests Act** - describes the requirements with respect to forest allocation.

<tbody>
<tr>
<td>Alberta</td>
<td>The Department of Sustainable Resource Development, including the Forestry Division, Fish and Wildlife Division, and Lands Division or as amended from time to time.</td>
</tr>
<tr>
<td>Alberta Vegetation Inventory (AVI)</td>
<td>An inventory of vegetation and forest stands including non vegetated areas.</td>
</tr>
<tr>
<td>Analysis</td>
<td>A detailed examination of a body of data, a series of decisions, or the implications of one or more policies, and a determination of what this examination reveals about the nature, function and/or relationships in effect.</td>
</tr>
<tr>
<td>Annual allowable cut (AAC)</td>
<td>The volume of timber that can be harvested under sustained-yield management in any one year, as stipulated in the pertinent approved forest management plan. In Alberta it is the quadrant cut divided by the number of years in that quadrant, usually five.</td>
</tr>
<tr>
<td>Annual Operating Plan (AOP)</td>
<td>A plan prepared and submitted by the forest operator each year, which provides the authorization to harvest. An AOP is a requirement of the Timber Management Regulation. (see section B 1.4)</td>
</tr>
<tr>
<td>Approval</td>
<td>Issued by Alberta. Approval Decision is prepared outlining significant items considered in plan approval and outlining conditions to be met within specified time periods by the Organization or a decision made by Alberta on an AOP.</td>
</tr>
<tr>
<td>As built harvest boundary</td>
<td>An opening number accompanied by a spatial depiction of the harvest area generated either from cutover photography or from GPS technology capable of 3m or better accuracy.</td>
</tr>
<tr>
<td>Assumptions</td>
<td>A judgmental decision made by a planner or decision maker that supplies missing values, relationships, or societal preferences for some informational component necessary for making a decision.</td>
</tr>
<tr>
<td>Audit</td>
<td>An official examination and verification of records, activities, accounts, actions, operations, etc., against stated standards of performance and compliance.</td>
</tr>
<tr>
<td>Bared soil</td>
<td>Any soil where the organic layers and vegetation have been removed.</td>
</tr>
<tr>
<td>Borrow pit</td>
<td>A small quarry or excavation, which provides material for use in the construction project. [Revised from Dunster]</td>
</tr>
<tr>
<td>Buffer</td>
<td>Used in several contexts. 1 In protecting critical nesting habitat areas, the buffer is an area of forest land that reduces the impacts of adjacent activities on the critical area. The dangers associated with adjacent disturbances might include wind-throw or wind damage to nest trees and young birds in the nest, increased predation and loss of interior forest conditions. 2 A strip of land between two areas under different management regimes. Pesticide buffer zones are used to limit the possible drift, run-off or leachate of pesticide from a site into other areas, such as waterbodies or creeks. Streamside buffers are used to limit the effects of logging on creeks, such as siltation, loss of shading, loss of nutrient inputs from trees and degradation of riparian zones. The size and composition of the buffer zone depends on its intended function. 3 An area maintained around a sample or experimental plot to ensure that the latter is not affected by any treatment applied to the area beyond the buffer. 4 In GIS work, a new polygon computed on distance from a point, line or existing polygon. 5 In managing biosphere reserves, an area or edge of a protected area. Examples of compatible activities might include tourism, forestry, agroforestry, etc. The objective of the buffer zone is to provide added protection for the core reserve area. [Dunster]</td>
</tr>
<tr>
<td>Coarse filter</td>
<td>Conservation of land areas and representative habitats with the assumption that the needs of all associated species, communities, environments and ecological processes will be met. [Dunster]</td>
</tr>
<tr>
<td>College</td>
<td>The College of Alberta Professional Foresters (CAPF) or the College of</td>

</thead>
<tbody>
<tr>
<td>Commercial Thinning</td>
<td>A partial cut where trees of a merchantable size and value are removed to provide an interim harvest while maintaining a high rate of growth on the remaining, well-spaced, final crop trees. Used to capture volume likely to succumb to competition pressures and be lost to disease, insect, or dieback.</td>
</tr>
<tr>
<td>Commercial timber permit (CTP)</td>
<td>A timber disposition issued under Section 22 of the Forests Act authorizing the permittee to harvest public timber.</td>
</tr>
<tr>
<td>Compaction</td>
<td>A transfer of wheel pressure to soils causing collapse of large air-filled pores, a type of disturbance when tire imprint is often invisible under the duff layer. Soil susceptibility to compaction is maximal when soil is at field capacity, which can be detected by stability of hand cast. Most of soil compaction occurs during the first passes of equipment because soil gains strength with each additional pass.</td>
</tr>
<tr>
<td>Compartment</td>
<td>A subsection of an FMA for which operational plans are developed.</td>
</tr>
<tr>
<td>Connectivity</td>
<td>A measure of how well different areas (patches or a landscape are connected by linkages, such as habitat patches, single or multiple corridors, or &quot;stepping stones&quot; of like vegetation. The extent to which conditions among late successional/climax forest areas provide habitat for breeding, feeding, dispersal and movement of late successional - or climax-dependent wildlife or fish species. Natural landscapes often tend to be better connected than those that have been heavily influenced and disturbed by human activities. Consequently, there is a body of opinion that the best way to avoid fragmentation of landscapes is to maintain, or re-establish, a network of landscape linkages. At a landscape level, the connectivity of ecosystem functions and processes is of equal importance to the connectivity of habitats. [Dunster]</td>
</tr>
<tr>
<td>Constraints</td>
<td>The restriction, limiting, or regulation of an activity, quality or state of being to a predetermined or prescribed course of action or inaction. Constraints can be a result of policies or political will; management direction, attitudes and perceptions; or budget, time personnel and data availability limitations; or, more typically, a complex interaction of all these factors. [Dunster]</td>
</tr>
<tr>
<td>Corridor</td>
<td>1 A physical linkage connecting two areas of habitat and differing from the habitat on either side. Corridors are used by organisms to move around without having to leave the preferred habitat. A linear habitat patch through which a species must travel to reach habitat more suitable for reproduction and other life sustaining needs. Many corridors, linking several patches of habitat, form a network of habitats. The functional effectiveness of corridors depends on the type of species, the type of movement, the strength of the edge effects and its shape. 2 An area of uniform width bordering both or one side of a linear feature, such as a stream or route. [Dunster]</td>
</tr>
<tr>
<td>Cross-drainage structures</td>
<td>Culverts or other drainage structures that permit water to move from one side of a road to the other, normally under the road grade.</td>
</tr>
<tr>
<td>Deactivation</td>
<td>Taking a road out of active use through implementation of erosion control measures, road blocks and/or other methods.</td>
</tr>
<tr>
<td>Deciduous timber allocation (DTA)</td>
<td>A quota of deciduous timber.</td>
</tr>
<tr>
<td>Delegated Authority</td>
<td>The government personnel located at the Regional or Area level charged with supervision of all forest management activities in a defined Region or Area. It can also mean someone who is authorized to approve an AOP.</td>
</tr>
<tr>
<td>Deleterious material</td>
<td>Section 34(1) of the Fisheries Act defines “deleterious substance” as: (a) any substance that, if added to water, would degrade or alter or form part of a process of degradation or alteration of the quality of that water so that it is rendered or is likely to be rendered deleterious to fish or fish habitat or to the use by man of fish that frequent that water; or (b) any water that contains a substance in such quantity or concentration, or that has been so treated, processed or changed, by heat or other means, from a natural state that it would, if added to any other water, degrade or alter or form part of a process of degradation or alteration of the quality of that water so that it is rendered or is likely to be rendered deleterious to fish or fish habitat or to</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>------</td>
<td>------------</td>
</tr>
<tr>
<td>Department License of Occupation</td>
<td>A disposition issued by Alberta authorizing occupation of a linear corridor, often for an access road.</td>
</tr>
<tr>
<td>Desired Future Forest</td>
<td>A spatially explicit projected range of conditions of the forest landscape 100+ years into the future. The range of forest conditions defines the goal towards which forest management will be directed. It is our best guess today on the arrangement of forest age classes, roads and habitats that will provide for a set of objectives and desired outcomes that have been identified for the area.</td>
</tr>
<tr>
<td>Displaced soil</td>
<td>Mixed mineral, surface and sub-surface horizons that have been deposited off the road or disturbed surface to a depth of 15 cm or greater.</td>
</tr>
<tr>
<td>Disturbance patterns</td>
<td>The spatial and temporal arrangement of disturbances.</td>
</tr>
<tr>
<td>Ditch blocks</td>
<td>Barriers constructed across ditches to retard water flow, to redirect water from the ditch or to form a small catch basin.</td>
</tr>
<tr>
<td>Drought</td>
<td>Extended period of below average precipitation causing a lowering of the water table. Generally occurs over several years but locally may happen seasonally. Signs would be lowering of lake levels and drying of streams that would normally flow all year.</td>
</tr>
<tr>
<td>Due Diligence</td>
<td>- taking and documenting steps to ensure that the desired outcome is achieved or that the chances of a negative consequence or outcome is minimized; - ensuring completeness, correctness, consistency and repeatability; - demonstrating how conclusions were reached; - using mechanisms, such as but not limited to checklists and standard operating procedures, to demonstrate that appropriate procedures were followed and to ensure that no relevant steps or considerations were missed; - keeping and maintaining appropriate files and filing systems as well as document retention policies and practices.</td>
</tr>
<tr>
<td>Duff</td>
<td>The organic horizons of the soil profile (LFH). Commonly referred to as the forest floor.</td>
</tr>
<tr>
<td>Dwarf mistletoe</td>
<td><em>Arceuthobium americanum</em> Nutt.</td>
</tr>
<tr>
<td>Ecological integrity</td>
<td>The quality of a natural, unmanaged or managed ecosystem in which the natural ecological processes are sustained, with genetic, species and ecosystem diversity assured for the future. [Dunster]</td>
</tr>
<tr>
<td>Environmental field report (EFR)</td>
<td>A document that must be submitted for most green area disposition applications as required under the Public Lands Act. The disposition applicant completes the EFR, which includes details on construction practices and environmental issues, and contains operating conditions that apply to the approved disposition. The EFR forms part of the approval for the Public Lands Act disposition.</td>
</tr>
<tr>
<td>Features</td>
<td>The features represented on a map which describe the physical aspects of the harvest design e.g., harvest area boundaries, roads, buffers, wildlife habitat.</td>
</tr>
<tr>
<td>FireSmart Community Zone</td>
<td>A standard 10 kilometre radius around the community extending from the Wildland Urban Interface Zone. A unique data set will be gathered for this zone for community protection planning to provide a fundamental linkage between FireSmart Communities and FireSmart Landscapes.</td>
</tr>
<tr>
<td>FireSmart Landscape Zone</td>
<td>This zone extends beyond the FireSmart Community Zone overlapping multiple jurisdictions at a broad landscape level. This zone focuses on mitigating the likelihood of large, high intensity, high severity fires. Fire, Forest and Land Management planning are integrated and designed to reduce the negative ecological, economic and social impacts of wildfire while maximizing the positive attributes of wildfire.</td>
</tr>
<tr>
<td>FireSmart Landscapes</td>
<td>The philosophy that seeks to mitigate the likelihood of large, high intensity and high severity fires. FireSmart landscapes are designed to recognize the interaction between ecological, economic and social impacts, hence maximize the positive ecological impacts and minimize the negative economic and social impacts.</td>
</tr>
<tr>
<td>Floodplains</td>
<td>Flat land bordering a stream or river onto which a flood will spread. The underlying materials are typically unconsolidated and derived from past stream transportation activity. The extent of the floodplain varies according to the...</td>
</tr>
<tr>
<td><strong>Ground Rules</strong></td>
<td><strong>Volume of water, and its 50-year-old floodplain would be defined by the largest flood that would, on average, occur once within a 50-year-period, estimated from historic stream flow records.</strong> [Dunster]</td>
</tr>
<tr>
<td><strong>Forest Health</strong></td>
<td><strong>A condition of the forest; a forest is considered healthy if it can sustain itself to meet the specific forest land management objectives of today or in the future.</strong></td>
</tr>
</tbody>
</table>
| **Forest Management Agreement (FMA)** | **A contract between the province of Alberta and the FMA holder whereby the province provides an area-based Crown timber supply. In return, the FMA holder commits to the following:**  
- managing the timber resource on a perpetual sustained yield basis, taking into consideration a broad range of forest values in determining forest management practices;  
- meeting defined economic objectives, including capital investment and job creation, and seeking out new business opportunities that provide measurable economic benefits for both the province and the FMA holder.  
The FMA gives the FMA holder the right to access Crown fibre. In return, the FMA holder commits to forest management responsibilities, which may change from time to time. |
| **Forest Management Unit (FMU)** | **An administrative unit of forest land designated by the Minister, as authorized under Section 14(1) of the **Forests Act**.** |
| **Forest operations** | **Includes all activities related to timber harvesting, including site assessments, planning, road construction, harvesting, reclamation and reforestation.** |
| **Forest operator** | **The timber disposition holder or person responsible for controlling harvest planning and operations in the timber disposition. It also refers to those persons working on behalf of the disposition holder while conducting forest operations.** |
| **Forest tent caterpillar** | **Malacosoma disstria** |
| **Forests Act, the** | **The legislative statute that authorizes the Minister to administer and manage the forested lands of Alberta.** |
| **Full Review** | **An evaluation of the acceptability for approval of a submitted document involving referrals to government departments, independent experts, or others as appropriate, and a risk analysis prior to Alberta granting approval to the submitting Organization.** |
| **Genetic Diversity** | **The genetic variability within a population or a species; the number and relative abundance of alleles. Genetic diversity can be assessed at three levels:**  
- diversity within breeding populations;  
- diversity between breeding populations within any one geographic area;  
- diversity within the species. |
| **Grazing disposition** | **An authorization issued by Alberta for the purpose of domestic livestock grazing on public land (i.e., lease, license or permit).** |
| **Ground Rules** | **Standards for operational planning and field practices that must be measurable and auditable and based forest management plan objectives.** |
| **Guideline** | **A preferred or advisable course of action respecting land and resource management. Guidelines imply a degree of flexibility, based on administrative judgment or feasibility of applying the guideline, and are consequently not normally enforceable through legal means.** |
| **Harvest area** | **A specified land area with defined boundaries where timber harvesting is scheduled, or has occurred (commonly referred to as a cut block).** |
| **Harvest Level** | **A volume or area of timber determined through timber supply analysis available for harvest on an annual sustainable basis within a DFA. A harvest level is not an AAC unless approved by the Minister.** |
| **Hiding cover** | **See “sight distance”.** |
| **High-water mark** | **Stream course water levels corresponding to the top of the unvegetated channel or lakeshore.** |
| **Historical resource** | **Any work of nature or man that is primarily of value for its palaeontological, archaeological, prehistoric, historic, cultural, natural, scientific or aesthetic interest, including, but not limited to, the structure or object and its surrounding site.** |
| **Insects and Diseases** | **Biological, physiological, and environmental agents that have an adverse effect** |
on the health of the forest. These agents include insects; nematodes; microorganisms (viruses, bacteria, fungi); parasitic plants; mammals; birds; and non-infectious disorders caused by climate, soil, applied chemicals, air pollutants and other physiographic conditions.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integrated resource plan</td>
<td>A regional plan developed by provincial government agencies in consultation with the public and local government bodies. It provides strategic policy direction for the use of public land and its resources within the prescribed planning area. It is used as a guide for resource planners, industry and publics with responsibilities or interests in the area.</td>
</tr>
<tr>
<td>Jack pine budworm</td>
<td><em>Choristoneura pinus.</em></td>
</tr>
<tr>
<td>Laid out</td>
<td>Field assessment of harvest blocks and roads (on the ground) required prior to submission of Forest Harvest Plan(s); also includes the delineation/marking of both harvest area boundaries and roads on the ground. Examples of delineation/marking include but are not limited to: ribbon, paint or other means approved by Alberta.</td>
</tr>
<tr>
<td>Landing</td>
<td>Any area where logs are gathered for processing or further transport to a mill site.</td>
</tr>
<tr>
<td>Landscape</td>
<td>A landscape (or LMU) is a heterogeneous area in which the pattern of the mosaic of local ecosystems or land uses is repeated in similar form throughout kilometres wide area (after Forman 1986). Landscapes may coincide with a climatic, physiographic or ecological boundary. However, landscapes are not strictly ecologically based and include human use and modification of the area.</td>
</tr>
<tr>
<td>Large residual tree</td>
<td>A residual tree with a diameter measured at breast height (DBH) greater than the approximate average merchantable tree DBH of the harvest area.</td>
</tr>
<tr>
<td>Large woody debris</td>
<td>Woody material &gt; 1 cm in diameter, stumps and snags &lt; 1.3 m tall and dead trees leaning &gt; 45 degrees. The woody material left on site after logging including both pre-existing and harvest-generated material (downed boles, limbs, tops and stumps). Includes highly decomposed and vegetated material as long as it is recognizable as woody.</td>
</tr>
<tr>
<td>Lesser vegetation</td>
<td>Combination of shrubs, forbs and/or grasses.</td>
</tr>
<tr>
<td>Logfill</td>
<td>Stream crossings constructed with logs placed in a streambed parallel to the flow of the water.</td>
</tr>
<tr>
<td>Mature stands</td>
<td>Stands that have reached rotation age or have a decreasing growth rate.</td>
</tr>
<tr>
<td>Mountain pine beetle</td>
<td><em>Dendroctonus ponderosae.</em></td>
</tr>
<tr>
<td>Non-traditional access</td>
<td>Access with conditions on the disposition limiting its use by the public.</td>
</tr>
<tr>
<td>Organization</td>
<td>The proponent charged with developing the FMP. This may be a corporation, cooperative, or a public agency.</td>
</tr>
<tr>
<td>Partial cutting</td>
<td>A treatment where significantly less than 100% of the trees are harvested from a stand or area. It includes commercial thinning, even when the intention is leading to a final clearcut.</td>
</tr>
<tr>
<td>Pattern</td>
<td>The arrangement of forest stands or harvest units.</td>
</tr>
<tr>
<td>Permanent roads</td>
<td>Roads that will be in use for more than three years.</td>
</tr>
<tr>
<td>Permanent sample plots (PSP)</td>
<td>A fixed or variable area plot established for (forest) sampling and measurement purposes, and designed for remeasurement.</td>
</tr>
<tr>
<td>Pre-commercial Thinning</td>
<td>A silvicultural treatment to reduce tree density in young stands, carried out before the stems reach merchantable size. The intent is to concentrate the site’s growth potential on fewer trees thereby accelerating stand development and reducing the time to final harvest, retaining more live crown, creating opportunities for future commercial thinning activities and improving stand operability.</td>
</tr>
<tr>
<td>Prescribed burn</td>
<td>The planned use of carefully controlled fire to accomplish predetermined management goals (e.g., site preparation for planting, reduction of fire hazards or pest problems, improvement of the ease with which the site can be traversed, and creation of better quality browse for wildlife). [Dunster]</td>
</tr>
<tr>
<td>Prohibited debris</td>
<td>Any flammable debris or waste material that, when burned, may result in the release of dense smoke, offensive odours or toxic air contaminants. It includes:</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>------</td>
<td>------------</td>
</tr>
<tr>
<td>Quota</td>
<td>The timber quota is a share of the allowable cut of coniferous timber within a forest management unit.</td>
</tr>
<tr>
<td>Reclamation of roads</td>
<td>Permanent removal of watercourse crossings; re-contouring of road crown and ditches; reseeding or planting of the former right-of-way.</td>
</tr>
<tr>
<td>Recreation Site</td>
<td>Includes areas designated by Alberta as Ecological Reserves, Wilderness Areas, Wildland Parks, Provincial Parks, Heritage Rangelands, Natural Areas, and Recreation areas.</td>
</tr>
<tr>
<td>Regeneration</td>
<td>The renewal of a tree crop by natural or artificial means. It may also refer to the young crop itself.</td>
</tr>
<tr>
<td>Regulated Forestry Professional</td>
<td>A Registered Professional Forester (RPF) on the Registered Professional Forester Register of the College of Alberta Professional Foresters (CAPF) or a Registered Professional Forest Technologist (RFPT) on the Registered Professional Forest Technologist Register of the College of Alberta Professional Forest Technologists (CAPFT).</td>
</tr>
<tr>
<td>Reserve</td>
<td>In its strictest sense, an area of land designated as being off-limits to any exploitive activities that might change the nature of the area. Not all reserves are so tightly controlled. [Dunster]</td>
</tr>
<tr>
<td>Residual structure</td>
<td>Standing structure that is taller than 2 m, within a harvested area. Areas buffered for sensitive ecological or wildlife habitat may be included for residuals. Required buffers for lakes and small and large permanent streams are not included. This includes non-merchantable trees and shrubs, live merchantable trees, snags and stumps.</td>
</tr>
<tr>
<td>Residual tree</td>
<td>A live canopy tree that is spatially within a harvested area. Areas buffered for sensitive ecological or wildlife habitat may be included for residuals. Required buffers for lakes, small and large permanent streams are not included.</td>
</tr>
<tr>
<td>Resources</td>
<td>Physical and intrinsic features of the land, including but not limited to timber, wildlife, water and soil.</td>
</tr>
<tr>
<td>Review</td>
<td>Acceptance or appraisal conducted by Alberta.</td>
</tr>
<tr>
<td>Right-of-way (ROW)</td>
<td>A cleared area, usually linear, containing a road and its associated features such as shoulders, ditches, cut and fill slopes, or the area cleared for the passage of utility corridors containing power lines or over- or under-ground pipelines. Typically, the right-of-way is a specially designated area of land having very specific rights of usage attached. Rights-of-way may be owned by someone else. [Dunster]</td>
</tr>
<tr>
<td>Riparian area or management zone</td>
<td>(1) The band of land that has a significant influence on a stream ecosystem or is significantly affected by the stream. It often has specialized plant and animal communities associated with it. [Anon] (2) Terrestrial areas where the vegetation complex and microclimate conditions are products of the combined presence and influence of perennial and/or intermittent water, associated high water tables and soils that exhibit some wetness characteristics. Normally used to refer to the zone within which plants grow rooted in the water table of these rivers, streams, lakes, ponds, reservoirs, springs, marshes, seeps, bogs and wet meadows. The riparian zone is influenced by, and exerts an influence on, the associated aquatic ecosystem. [Dunster]</td>
</tr>
<tr>
<td>Root collar weevils</td>
<td><em>Hylobius</em> spp.</td>
</tr>
<tr>
<td>Rotation</td>
<td>The period of years required to establish and grow even-aged timber crops to a specified condition of maturity.</td>
</tr>
</tbody>
</table>
| Ruts | Machine depressions in the soil which are determined by depth and length: - where the depth of the organic dark humus material is greater than 30 cm, a rut is a depression that shears the organic layer of soil (a sheared organic will
**Upper Hay Regional Ground Rules**

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rutting/ puddling</td>
<td>A paste-like behaviour of wet soil when most of the soil pores are filled with water and soil literally flows from underneath the wheel to the sides and upward forming visible tire imprint into the mineral soil. Intensity/depth of rutting is directly related to the number of equipment passes. Soil is considered susceptible to rutting when it forms a stable hand cast.</td>
</tr>
<tr>
<td>Sensitive sites</td>
<td>Sites that have soil, water, slope, aesthetic, vegetation or wildlife characteristics that require special protection beyond the normal precautions described in the ground rules. They may be complex if many values or issues are involved.</td>
</tr>
<tr>
<td>Seral stages</td>
<td>A stage in succession. A series of plant community conditions that develop during ecological succession from a major disturbance to the climax stage. Most common characteristics/classifications include tree species and age.</td>
</tr>
<tr>
<td>Sight distance</td>
<td>The distance at which 90% or more of an adult big game animal is hidden from the view of a human. This distance may vary from one stand to another.</td>
</tr>
<tr>
<td>Silt fence</td>
<td>Permeable fabric barriers installed along the contour to filter surface water runoff and trap sediment from sheet or overland flow and prevent it from entering streams.</td>
</tr>
<tr>
<td>Silviculture</td>
<td>The theory and practice of controlling the establishment, composition, health, structure and growth of forests in order to achieve specified management objectives.</td>
</tr>
<tr>
<td>Site preparation</td>
<td>Any action taken in conjunction with a reforestation effort (natural or artificial) to create an environment favourable for survival of suitable trees during the first growing season. Altering the ground cover, soil or microsite conditions can create this environment; using biological, mechanical or manual clearing; prescribed burns; herbicides or a combination of methods. [Dunster]</td>
</tr>
<tr>
<td>Skid trail</td>
<td>An unimproved temporary forest trail suitable for use by equipment such as bulldozers and skidders in bringing trees or logs to a landing or road.</td>
</tr>
<tr>
<td>Small patch</td>
<td>A patch of less than 0.2 ha of undisturbed canopy forest surrounded by harvested area. The patch must be composed of at least four canopy trees. At least two of the trees in the patch should be large residual trees.</td>
</tr>
<tr>
<td>Snag</td>
<td>A dead tree that is taller than 2 m.</td>
</tr>
<tr>
<td>Soil Displacement</td>
<td>A loss of nutrient-rich organic layers, and top mineral soil as a result of harvesting activities. Bare mineral soil is susceptible to raindrop impact causing soil crusting, increased surface runoff, and erosion.</td>
</tr>
<tr>
<td>Soil disturbance</td>
<td>In the context of the 5% maximum allowable area within a harvest area, includes bare landing areas, temporary roads, displaced soils or ruts.</td>
</tr>
<tr>
<td>Spatial</td>
<td>Of, or existing in, space. [Webster’s]</td>
</tr>
<tr>
<td>Species at risk</td>
<td>Any species known to be “at risk” after formal detailed status assessment and designation as “Endangered” or “Threatened” in Alberta. The list of species is maintained by Alberta.</td>
</tr>
<tr>
<td>Species of management concern</td>
<td>Species within the forest management planning area that have an identified value (social, economic, ecological) and are managed to ensure their continued protection and/or use. This includes species that are hunted or trapped, as well as those that are endangered or threatened.</td>
</tr>
<tr>
<td>Spruce beetle</td>
<td><em>Dendroctonus rufipennis</em>.</td>
</tr>
<tr>
<td>Stand</td>
<td>A community of trees sufficiently uniform in species, age, arrangement or condition as to be distinguishable as a group in the forest or other growth in the area. A stand may also be that polygon as defined in the AVI or Phase III inventory.</td>
</tr>
<tr>
<td>Strippings</td>
<td>Layers of humus-bearing topsoil and fine woody material above mineral soil.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>------</td>
<td>------------</td>
</tr>
<tr>
<td>Stub</td>
<td>A large residual tree that has been “topped off” at approximately 6 m to create an artificial snag.</td>
</tr>
<tr>
<td>Subsequent pass</td>
<td>Any harvest occurring after the first harvest pass.</td>
</tr>
<tr>
<td>Suppression capability</td>
<td>The effectiveness of traditional fire suppression tactics. It is an objective evaluation of initial attack response time, access for ground support resources, water availability and terrain which might adversely impact movement of resources.</td>
</tr>
<tr>
<td>Sustainable forest management (SMF)</td>
<td>Management to maintain and enhance the long-term health of forest ecosystems, while providing ecological, economic, social and cultural opportunities for the benefit of present and future generations.</td>
</tr>
<tr>
<td>Temporal</td>
<td>Of, or limited by, time. [Webster’s]</td>
</tr>
<tr>
<td>Temporary field authority (TFA)</td>
<td>An authority issued under Section 19 of the Public Lands Act by an Alberta officer to grant short-term land use activities on public land in the White or Green Areas. The TFA may or may not be related to an existing disposition that has also been issued under the Public Lands Act. The concept is to provide field-level service to an applicant, with access to public land for a specific purpose/use/activity, for a term of less than or equal to one year.</td>
</tr>
<tr>
<td>Temporary road</td>
<td>Roads that are part of a harvest area or that connect harvest areas, and are built, used and reclaimed before expiry of the Annual Operating Plan (AOP) or reclaimed within three years of construction.</td>
</tr>
<tr>
<td>Thermal cover</td>
<td>Generally, an area of at least 10 ha having a coniferous canopy at least 10 m in height, with at least 70% crown closure and a minimum width of 200 m. This cover is used by animals to assist in their temperature regulation during extreme weather conditions.</td>
</tr>
<tr>
<td>Timber disposition</td>
<td>Licenses and permits that allow forest operators to harvest from Crown lands.</td>
</tr>
<tr>
<td>Timber Management Regulation</td>
<td>The legislative statute that describes the mechanism and regulations by which the forested lands of Alberta are managed. The Regulation is associated with the Forests Act.</td>
</tr>
<tr>
<td>Timber Operations</td>
<td>Includes all activities related to timber harvesting including site assessments, planning, road construction, harvesting, reclamation and reforestation.</td>
</tr>
<tr>
<td>Timber supply analysis (TSA)</td>
<td>Calculations/computer models with built-in assumptions regarding forest growth patterns, used to determine the annual allowable cut (AAC).</td>
</tr>
<tr>
<td>Timing constraints</td>
<td>A restriction or limitation on when an activity may be carried out.</td>
</tr>
<tr>
<td>Trapper</td>
<td>Holder of a trapping license.</td>
</tr>
<tr>
<td>Understory</td>
<td>The trees and other woody species growing under the canopies of larger adjacent trees and other woody growth. [Dunster]</td>
</tr>
<tr>
<td>Unstable slope</td>
<td>Slopes of loose or poorly consolidated materials beyond the angle of repose, geological features having a high probability of failure, or soils that will not support loads.</td>
</tr>
<tr>
<td>Utilization</td>
<td>The portion of the stand or individual tree used for manufacture of wood products, defined in terms of piece length and diameter at each end. Minimum standards for utilization are defined in the timber disposition.</td>
</tr>
<tr>
<td>Validated work (Validation)</td>
<td>Work that has been prepared by, or reviewed and approved by an RFP. These professionals are subject to an enforceable code of ethics and standards of practice and are expected to complete their work with due diligence to ensure such work is accurate. The RFPs who validate the work may have done the work themselves, contracted the work to be done, or supervised those who did the work, but in any case, the validating RFPs are accountable for the work being prepared with due diligence and being accurate. If more than one RFP is involved in preparing the work, the RFP that is most directly involved in the work is to validate the work.</td>
</tr>
<tr>
<td>Values at risk</td>
<td>A listing of values which may be at risk of being reduced by wildfire. In order to complete a spatial “priority” evaluation, information regarding values is required.</td>
</tr>
<tr>
<td>Variance (SHS)</td>
<td>Any deletion to a stand scheduled in the spatial harvest sequence. Additions to stands identified in the spatial harvest sequence are not considered variance but are tracked in section 3.4.1 of the ground rules.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------------------------------------------------============================================================================</td>
</tr>
<tr>
<td>Viable understory</td>
<td>Trees of desirable merchantable species that are windfirm and of sufficient vigour that they will continue to grow after harvest.</td>
</tr>
<tr>
<td>Water source area</td>
<td>That portion of a watershed where soils are water-saturated and/or surface flow occurs and contributes directly to streamflow. The area of saturated interflow associated with a stream.</td>
</tr>
<tr>
<td>Watercourse</td>
<td>The bed, bank or shore of a river, stream, creek or lake or other natural body of water, whether it contains or conveys water continuously or intermittently.</td>
</tr>
<tr>
<td>Watershed</td>
<td>An area of land, which may or may not be under forest cover, that drains water, organic matter, dissolved nutrients and sediments into a lake or stream. The topographic boundary, usually a height of land, that marks the dividing line from which surface streams flow in two different directions. [Dunster]</td>
</tr>
<tr>
<td>Western gall rust</td>
<td><em>Endocronartium harknesii</em>.</td>
</tr>
<tr>
<td>Wildlife</td>
<td>Any species of amphibian, bird, fish, mammal and reptile found in the wild, living unrestrained or free roaming and not domesticated. Some definitions include plants, fungi, algae and bacteria. [Dunster]</td>
</tr>
<tr>
<td>Wildlife corridor</td>
<td>A strip of forest with a minimum width of 100m or a series of forest retention patches that connect two forested areas. These may include merchantable or unmerchantable stems.</td>
</tr>
<tr>
<td>Wildlife zone</td>
<td>As defined on Fish and Wildlife Referral Maps.</td>
</tr>
<tr>
<td>Windfirm</td>
<td>The ability of a tree or stand of trees to remain standing post harvest.</td>
</tr>
<tr>
<td>Yield Curve</td>
<td>Graphical representation of a yield table.</td>
</tr>

**Schedule Change:**
- Copy ACP submitted to:
  - District Manager
  - Field Manager
  - Permit Holder
  - Chief Engineer

- Has any PHB conditions been altered?
- Has the Company requesting this relief been explained in an notification?
- Has any correspondence to ACP committee been submitted and justified (information program, OEA, TEP)?

**Operating Schedule (as per section 3.2.4.1):**
- Has a table been established for all MDCs schedules for harvest including areas of release by species with totals?
- Has a list of emergency work proposed for contracting, vegetation inspection and staging/watering carried out?

**Applicable Forest Harvest Plan (as per section 3.4):**
- Are all blocks included in the ACP Forest Harvest Plan?

**Reforestation Program (as per section 3.6.1):**
- Is the proposed reforestation treatment situation provided?
- Are the areas of natural and planted spruce, deciduous, deciduous, and coniferous provided?
- Is the site or location of the harvest in a situation?

**Wildlife Protection (as per section 7.5):**
- Is the Forest Stewardship Plan complete?

**Road Plan (as per section 11.2):**
- Are all roads identified in the local authority of the ACP Forest Harvest Plan a list of 70 items?
- Are all main roads considered for maintenance for use in the ACP Forest Harvest Plan?

**General Development Plan (as per section 11.2):**
- Has the landowner of the area been identified?
- Has the landowner of the area been informed by the CCQ?

**Company Sign Off:**

- Scheduling ACP Validation: Company: Date

**CCQA Sign Off:**

- Reviewing ACP Validation: Company: Date

---

**Note:** The ACP shall be approved by the Dept. of Forestry in accordance with the ACP Checklist, with approved signature in the manner of the approved.
