Introduction

- Postpartum uterine diseases (metritis or endometritis) are considered important factors that affect longevity and profitability of dairy herds.
- It is well documented that metritis (uterine infections that happen < 21 d after calving) is associated with poor reproductive performance, reduced dry matter intake (DMI) and milk yield (MY).
- However, the relationship between endometritis (uterine infections that happen > 21 d after calving) and DMI or MY has not been investigated.

Objective

- To evaluate the effect of different categories of endometritis on reproductive performance, DMI and MY.

Methodology

- 126 lactating Holstein cows were examined for endometritis on 25 ± 1 d postpartum (dpp) using 3 different methods.

Table 1. Categories and definitions of endometritis

<table>
<thead>
<tr>
<th>Categories</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clinical (CLIN, n=45)</td>
<td>Mucopurulent discharge and/or presence of uterine fluid</td>
</tr>
<tr>
<td>Cytological (CYTO, n=15)</td>
<td>No discharge or uterine fluid but ≥8% PMN</td>
</tr>
<tr>
<td>Clinical + cytological (CLINCYTO, n=30)</td>
<td>Discharge and/or uterine fluid and ≥8% of PMN</td>
</tr>
<tr>
<td>Unaffected (UNAF, n=36)</td>
<td>None of the above pathological conditions</td>
</tr>
</tbody>
</table>

Results

- Figure 1: Effect of categories of endometritis on first service conception rate.
- Figure 2: Effect of categories of endometritis on pregnancy rate up to 250 dpp. The proportion of non-pregnant cows at 250 dpp was higher in CLINCYTO (37%) than in UNAF (18%) groups.
- The overall DMI (24.0±0.5 kg) and MY (35.0±0.8 kg) up to 35 dpp were not affected by categories of endometritis.

Take home message

- Fertility at first AI was significantly affected in cows with all categories of endometritis.
- Fertility remained significantly lower up to 250 dpp in cows with CLINCYTO endometritis.
- Dry matter intake or milk yield was not significantly affected in cows with endometritis.
