Sclerotinia: Apothecia and ascospores

Factors that Contribute to Sclerotinia Stem Rot

1. Amount and availability of moisture
2. Suitable temperature
3. Favorable microenvironment (Within Crop Canopy)
4. Ascospores produced

Sclerotinia Stem Rot – Yield Impact

- Yield Loss
 - Estimated to be 5% annually in Canada
 - Severity in individual fields is the issue
 - Approximately 50% yield loss from each infected plant.

Effect of Rotation on sclerotinia stem rot incidence

Sclerotinia Tolerant Varieties

Table 1*
Disease resistance of hybrids under different levels of sclerotinia pressure

**This diagram does not account for extreme years when two fungicide applications are recommended by manufacturers.*

Sclerotinia Stem Rot Checklist

(For each risk factor, circle the risk points that apply to your field).

RISK FACTOR	POSSIBLE ANSWERS	RISK POINTS
NUMBER OF YEARS SINCE LAST CANOLA CROP	More than six years	0
	Three to six years	5
	One to two years	10
DISEASE INCIDENCE IN LAST HOST CROP	None	0
	Low (1 to 10%)	5
	Moderate (11 to 30%)	10
	High (31 to 100%)	15
CROP DENSITY	Low	0
	Normal	5
	High	10
RAIN IN THE LAST TWO WEEKS	Less than 10 mm (0.4")	0
	10 to 30 mm (0.4 to 1.2")	5
	More than 30 mm (1.2")	10
WEATHER FORECAST	High pressure	0
	Variable	10
	Low pressure	15
REGIONAL RISK FOR APOTHECIA DEVELOPMENT	None found	0
	Low numbers	10
	High numbers	15

TOTAL RISK POINTS FOR ALL RISK FACTORS =

> 40 points = Spray
< 40 points = Do not spray

Canola petal infection study

- Can we examine canola petals to determine if ascospores are present?
 - The Petal Test Kit developed by the University of Saskatchewan in 1991, used a selected agar plate assay to culture *S. sclerotiorum* fungus from canola petals

In Development – InnoTech Spore Sensor

CLUBROOT

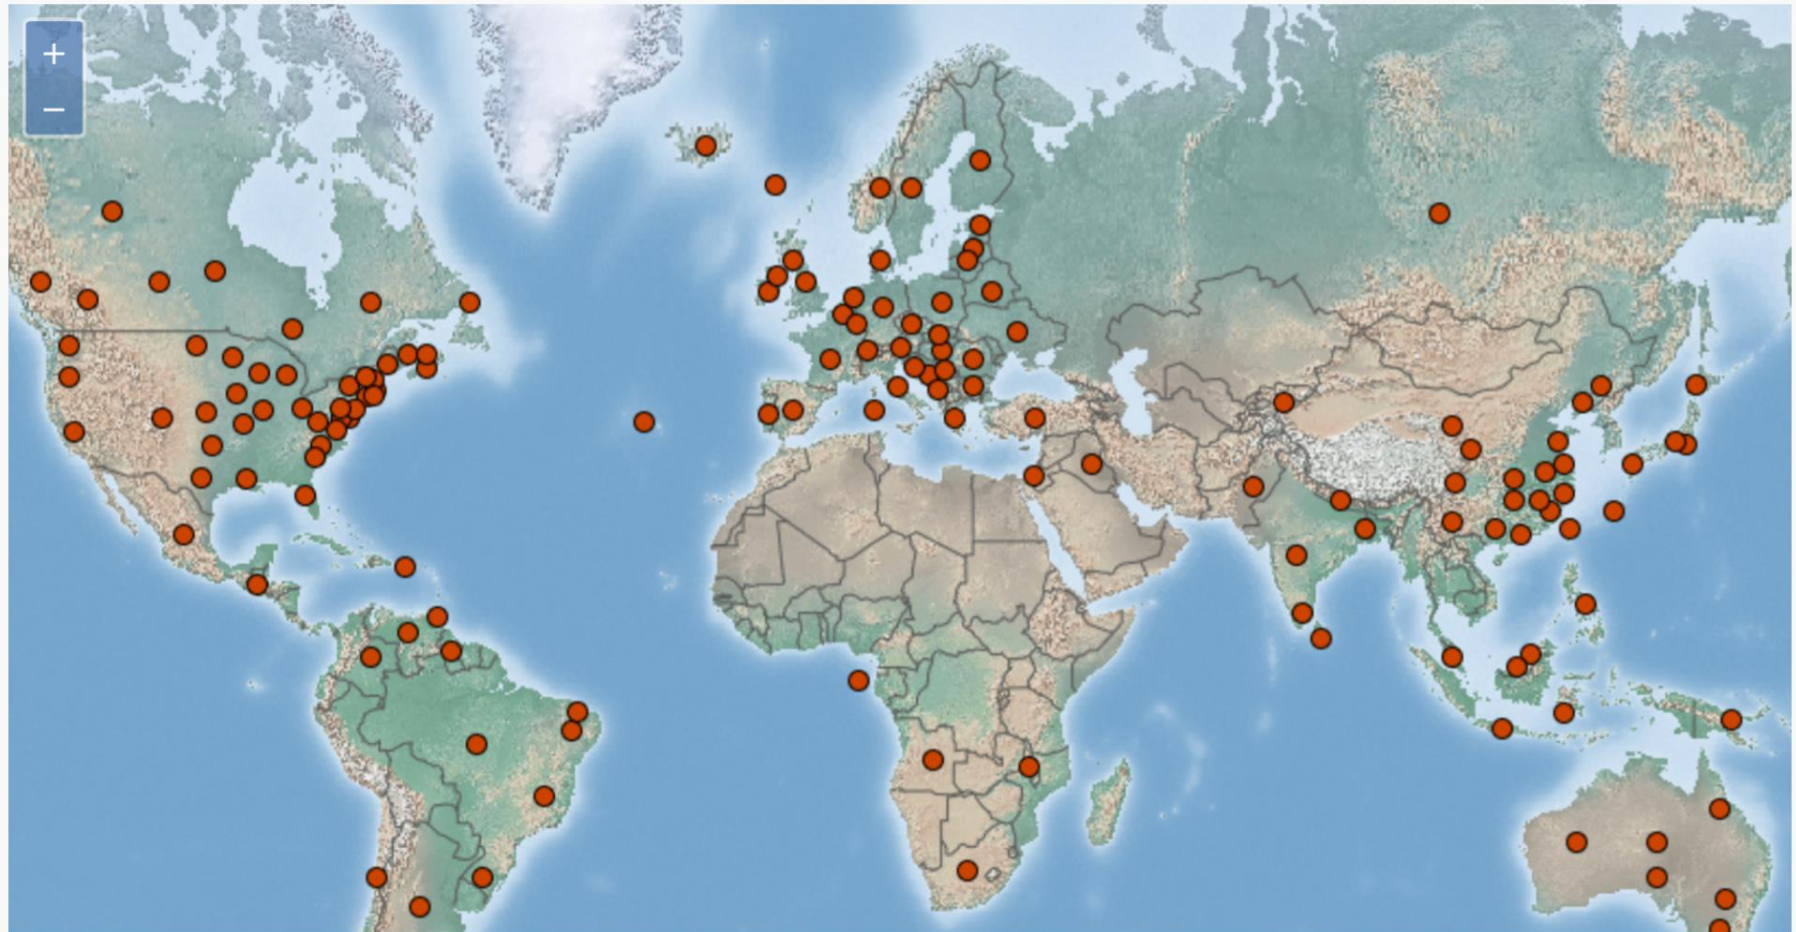

Toshinari M, Kubota T, Inami S, Fujita T, 1997. Development of a new fungicide, flusulfamide. Journal of Pesticide Science, 22: 176-184.

Clubroot by the Numbers

- First cases of clubroot - 2003
- >2,400 clubroot field infestations confirmed by 2016
- BIG year in 2017
- Emergence of new strains of *P. brassicae* capable of overcoming resistance has been an issue since 2013. Targeted survey for cases
- where resistance has been broken/eroded. 19 Strains confirmed in Canada.

2017 Survey

- Clubroot identified for the first time in ~~five~~ six new counties:
 - Big Lakes (Peace Country)
 - Brazeau
 - Lac La Biche
 - Paintearth
 - Wainwright
 - Greenview
- Now confirmed in 37 counties/MDs & 3 urban centers

Update on New Pathotypes

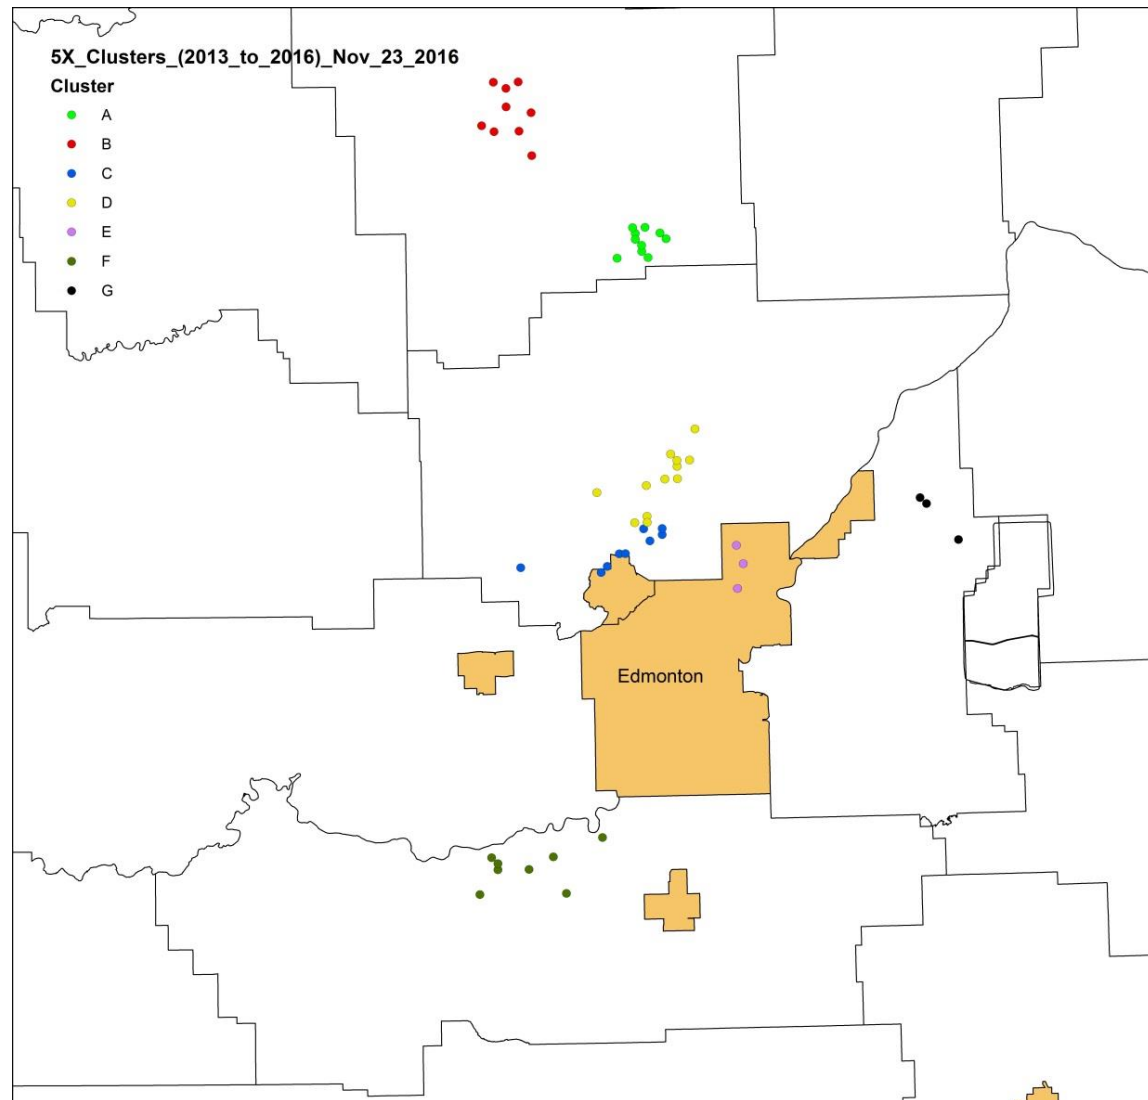

- Number of fields where clubroot resistance has been overcome

Year	Fields of CR canola with symptoms	Fields in which new strains confirmed
2013	6	2
2014	24	16
2015	37	24
2016	42	22
Total	109	64

+ >30 in 2017

Clusters of Fields with New Strains

- Fields with resistance issues appear to occur in clusters
- Suggests independent selection for new strains & dissemination to nearby fields

MAINTAINING GENETIC RESISTANCE ?

- **Minimize introduction/establishment of clubroot**
- **Deploy resistant varieties EARLY**
- **Lengthen your crop rotation**
- **Practice sanitation – minimize soil movement**
- **Use additional tools**
 - **Grassed approach area**
 - **Revisiting Liming and patch management**

BLACKLEG

Resistance Identification

Resistance Rating

% of Westar Check

R

0-29.9

MR

MS

50-69.9

S

70-100

- WCC/RRC field testing protocol

Westar(BL susceptible) vs. "R" Rated variety

Resistance is NOT immunity!

Blackleg Resistance

- Resistance Genes
 - **Major gene resistance:** seedling resistance and race specific
 - **Quantitative resistance:** adult plant resistance and broad

No resistance
= disease

Major gene
(seedling) resistance
= no disease

Minor gene (adult
plant) resistance
= some disease

How Major Gene Resistance Works:

New Blackleg Major-Gene Labels

Major R gene resistance grouping (RG)

- RG A = *Rlm1* or *LepR3**
- RG B = *Rlm2*
- RG C = *Rlm3*
- RG D = *LepR1*
- RG E₁ = *Rlm4***
- RG E₂ = *Rlm7***
- RG F = *Rlm9*
- RG G = *RlmS*
- RG H = *LepR2*
- RG X = unknown

Rotate to a different R-gene group when blackleg increases substantially in a field

New variety labels:

- R(BC) = resistant rated variety with major genes *Rlm2* and *Rlm3*
- MR(C) = moderately-resistant rated variety with major gene *Rlm3*

R

R (AB)

R (CX)

What's a R-gene rotation system?

For blackleg management, this means rotating the major genes being deployed in a field to help match the pathogen population within it.

Blackleg Risk Assessment Matrix

- **Canola in rotation.** Tightened canola rotations allow for blackleg inoculum to build within the field. Extending canola rotations (greater than a two year break from canola) will allow more time for inoculum levels to decline, as old canola stubble decomposes.
- **Scout for the disease.** Look for internal stem blackening at ground level during swathing or straight cutting, and for pseudothecia on previous year's canola residue prior to seeding. The presence of either will help determine the risk of infection in the next canola crop.
- **Field resistance used.** Plant either "Resistant" (R) or "Moderately Resistant" (MR) varieties. Resistant varieties outperform susceptible or bin run seed.
- **Major gene rotation.** Rotate varieties by their major gene. Like herbicide rotation, using a new resistance group can help target the susceptible blackleg races within the field.
- **Fungicide use.** An early season fungicide application will help to protect the crop from yield loss from blackleg. Timing is critical as blackleg causes the most damage when infection occurs during the cotyledon to 6 leaf stage. Later applications (after 6 leaf) can help reduce the amount of inoculum that will return to the field.

KEEP IT COMING

Sclerotinia stem rot summary

- Sclerotinia stem rot of canola is variable year to year and region to region, but related to moisture conditions.
- Many tools to control sclerotinia stem rot have been developed, but fungicides remain the best of these.
- New research, new resistant cultivars, and ability to predict spore release will improve our ability to manage this disease into the future.

BLACKLEG REMINDERS:

- Need to use an integrated pest management approach to minimize blackleg.
- Resistance does not infer immunity! We CANNOT rely solely on resistance breeding to manage canola diseases.
- Extended crop rotation will help solve many canola disease issues.
- First step is SCOUTING. Assess the problem and what further steps need to be taken.

CLUBROOT

Determine whether or not you have it:

- **Scout, scout, and scout**
 - **Early detection will be most successful**
 - Scout susceptible and resistant varieties
 - You may identify new pathotypes/strains by scouting resistant varieties closely
 - Scouting tips:
 - Look for patches of premature ripening.
 - Check at field entrances
 - Check areas with increased moisture, such as low spots or near sloughs.

So develop your clubroot plan now

- **Plan should include:**
 - **How will you isolate a field?**
 - **How will you plan your field work?**
 - **When will you sanitize your equipment?**
 - **When will you use resistant varieties?**

Don't wait until it's too late!
