# Enabling Technology

# RFID

# Disease Profile

-Healthy Calves on Pasture

-Weaned, Social disruption

-Transported

-Co-mingled, Auctioned

-Off feed/water

-Novelty / Stress

-Clinically Ill

# Weaned / Receiver Transition

- diet change
- social bond changes

- transport
- handling
- co mingling - exposure

- off feed
- off water
- multiple source

- illness ( 10 - 40%) **BRD**
- antibiotic use (\$15 )
- reduced performance
- reduced yield / grade / efficiency
- antibiotic resistance

# Infrared and Salivary Cortisol Changes Pre and post transport

## Salivary Cortisol Pre Transport

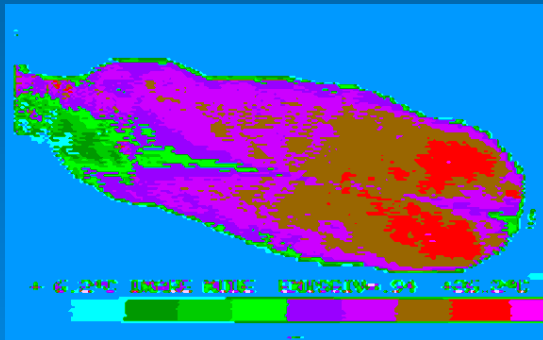

2.6 nmol/L

Lacombe Research Centre data on receiver feedlot cattle  
transported approximately 3h

## Salivary Cortisol Post Transport

5.2 nmol/L  $P < 0.05$

## Dorsal Infrared Pre-Transport

## Dorsal Infrared Post Transport

# Infrared (IRT) and rectal temperatures in receiver calves with two levels of stress

	IRT	RECTAL	C
Commercial Calves (multiple source, commingled. Higher stress)	21.6	39.1	n=242
Retained Possession (single source, retained possession. Lower stress)	17.3	39.4	n=296

# Infrared and Rectal Temperatures in Calves

	Infrared Temp C	Rectal Temp C
Day 1	21.88 C	39.4 C (103.0)
Day 3	29.03 C	39.9 C ( 103.9)
Change (n=7)	7.15 C 33%	0.5 C 0.8 %

# Eye Infrared Values and Clinical Scores BVD Infected Calves (ADRI)

Day 0

Day 10

Schaefer et al. 2004. Can. J. Anim. Sci. 84

# Penridge Feeders: Early Disease Detection Study

# Experimental Design

93 multiple sourced (3), commingled, transported weaned calves

**Not ill**

**Might be ill**

**ill**

# Components of a Disease Early ID Station For Cattle

## Monitored Weekly

- body wt
- core temp
- sal cort
- IRT orbital
- hematology/metabolites
- clinical score (ethology)

## Monitored Daily

- IRT orbital
- behaviour
- feed bunk/water

# Health and Treatment Identification: Pulled Calves

ID	FI	PC	RT	IRT	CS
4	A	A	N	A	A
	3		102.2	$\Delta T$	BRD
21	A	A	A	A	A
	?		105.6	39	BRD
24	A	A	N	A	A
	6		101.4	36.9 (low)	BRD
39	A	A	A	A	A
	12		105.5	38.6	BRD
72	A	A	A	A	A
	?		102.2	39.7	BRD
78	N	A	A	A	A
	0		104.1	38.9	BRD

-No calves would be identified early on the basis of RT alone; for PC, -false +vs /  
 - false -vs. A = abnormal, N = normal. Some 56 pulled calves total

# Future Focus

-complete analysis

-Prediction Index  
= IRT + FI / WI + Biol

-link engineering

-further research

Fence line system

## Orbital Max IRT Remotely Captured at Water Station

Mean # days identified earlier than clinical signs, 7 (Range 1-23)

# BRD Progression

Day 1

35.1 C

Day 4

37.7 C

Day 8

38.4 C

# Early Diagnostics:

## Non-Invasive Infrared vs Conventional Clinical Score

-Example ED04, 21 head of MSCMWTA calves (North Alta)

Using IRT:

- On arrival 10 ID'ed as suspect BRD using IRT
- Of these, 8 subsequently contracted BRD within 1-10 days (  of 3 days) ; - 2 false +ve and 5 false -ve

Using Clinical Signs:

- On arrival 2 animals ID'ed as suspect BRD using clinical signs ( $\geq 104^{\circ} \text{F}$ ); - no false +ve, 13 false -ve

# Alternative Strategies for Treatment (Combining Detection and Correction)

## Nitric Oxide

## Humane Hay

# Humane Hay Trial

## -Manipulating Amino Acid Precursors -Stress Management

- 186 Weaned, Transported Calves ( ave 668 lb)
- 4-5 h Transport (Pincher Creek to Olds College)
- Overall loss of liveweight 46 lb or 6.9%

- Control – normal grass hay 3-4 lb/head for 12h
- Humane Hay Treated 3-4 lb/head for 12 h

Control (n=89) lost 47.9 lb  $\pm$ 9.5

Humane Hay group (n=97) lost 42.8 lb  $\pm$ 10.8 (P<0.001)

Olds Agri-Tech

# Pilot Bovine Respiratory Disease Study

- Shipping Disease in Cattle clinically mimics URTI in humans
  - Malaise/Lethargy
  - Fever
  - Loss of appetite
  - Inflamed sinuses
    - Early Thermal Detection
  - Nostril discharge
  - Usual duration of 14 days

# Pilot Bovine Respiratory Disease Study

- Four Small Pilot Groups of Naïve Calves
  - Prophylactic treatment
  - Thermal detection treatment (early)
  - Clinical detection treatment (late)
  - Placebo Control treatment (uninfected)
- Infected Herd Exposure
- Treatment and Response Measurements

# Pilot Bovine Respiratory Disease Study

## ➤ Inhaled NO

- 100,000 ppm source tank
- Breath actuated delivery
- “J”-tube delivery line
- 8.27 mL pulse dose per breath
- 300 pulses/nostril
- 600 breaths during 20-30 minutes
- Estimated dose ~160 ppm

# Pilot Bovine Respiratory Disease Study

## ➤ Inhaled NO

- 100,000 ppm source tank
- Breath actuated delivery
- “J”-tube delivery line
- 8.27 mL pulse dose per breath
- 300 pulses/nostril
- 600 breaths during 20-30 minutes
- Estimated dose ~160 ppm

**-None of the calves early identified with IRT and then received a NO treatment developed clinical BRD**

## Summary: Reasons to Early Detect

1. Reduced Treatment Costs
2. Improved Efficacy of Treatment
3. Reduced Morbidity Period
4. Reduced Risk of Antibiotic Resistant Microbes
5. Improved Animal Performance
6. Reduced Labour for Treatment
7. Improved Animal Welfare
8. Improved Food Safety

# Summary

# Criteria For Illness

1. -behaviour suspect by pen checker
2. -suspect animals sampled for abnormal hem
3. -core temp was  $> 40\text{ C}$
4. -verification of illness by veterinarian

## -Criteria for Wellness

1. -None of the above symptoms

# Pilot Bovine Respiratory Viral Disease Study

## Prophylactic vs Thermal Detection Groups

Paired t-test  $p < 0.01$

Paired t-test  $p < 0.01$

# Values Used for Normal Ranges

( Blood Radostits and Henderson, 1983)

Pen Check	See Sheet
Rectal Temp	>40 C or 104 F
IRT (mean $\pm$ 1SD)	37.26 – 38.04(37.6)
WBC	4-12 X 10 <sup>9</sup> /L
RBC	5-10 X 10 <sup>12</sup> /L
Hg	8-15 g/dl
HCT	24-46 %
Clinical Score	Veterinarian

# Interesting Stuff:

- On pull day, 51 of 56 calves (91%) would have been identified on the basis of IRT eye temp.  
( either absolute IRT or  $\Delta T/d$ )
- Of these calves, approx 2/3 were hot and 1/3 cold
- On the basis of  $> 0.1 \text{ C } \Delta/d$  IRT,  $>80\%$  identified
- If RT was used to pull calves, 36% false +ve and some false -ve

# 57 calves Identified as Possibly ill

# INFRARED THERMOGRAPHY

## AN INDICATOR OF STRESS

# Background:

Reduced feeding behaviours are linked to early detection of morbidity, reduced performance and poor carcass quality in feedlot cattle (Basarab et al. 1997; Sowell et al. 1999)

Daily pattern of feeding behaviour for steer 16941096

620 lb initial weight  
Carcass weight=527 lb;  
B1; < 4 mm bf;  
54.7 sq cm;  
-\$252.15 net return

(Basarab et al. 1997, Can. J. Anim. Sci. 77: 554; Sowell et al. 1999, J. Anim. Sci. 77:1105)

## Cumulative feed intake for healthy, newly weaned steers and steers diagnosed with BRD on day 4-6 (BRD Early) of the feedlot period

# Pilot Bovine Respiratory Viral Disease Study

## ➤ Monitoring

- Core Temperature
- Saliva cortisol
- Orbital IRT
- Hematology
- NO metabolites
- Clinical score
- Behavior
